

Building public support for eradicating poverty in the UK

Joke Delvaux and Sini Rinne (Cambridge Policy Consultants)

June 2009

A look at different ways of building public support for tackling UK poverty.

Public support is necessary to encourage Government action to tackle UK poverty. However, building public support for this can be challenging.

This study:

- looks at successful ways of building public support for tackling UK poverty, including the use of 'real life' stories, for example;
- explores how organisations measure the effectiveness of their initiatives;
- finds that only few initiatives explicitly aim to build public support for the UK poverty agenda – and these initiatives tend to change perceptions and behaviour rather than attitudes; and
- argues that the term 'poverty' needs to be clarified, and possibly avoided when first engaging people.

Executive summary

Introduction

The overall aim of this research was to identify approaches and strategies that are successful in building public support for addressing UK poverty. This report is not another good practice guide on campaigning or measuring effectiveness. It aims to build on what others have done by starting from what is happening on the ground (as opposed to what should be happening) and what this tells us about the effectiveness of different approaches. The report does not linger on the absence of hard evidence of impacts. This lack of evidence is the starting point for the research, not its conclusion. The report aims to present a catalogue of the available hard data, anecdotal evidence and staff insights on impacts and effectiveness of activities aimed at building support for the UK poverty agenda. It offers a number of preliminary conclusions around what 'works' and invites other stakeholders to further build on these hypotheses.

Informing people about UK poverty

The research identified significant activity centred on *informing* people about levels of poverty in the UK and about what it actually means to live in poverty. Examples include poverty-awareness training sessions, the publication and dissemination of research on poverty in the UK and poverty-related documentaries and reality TV. There is fairly consistent anecdotal evidence of audiences, readers and recipients of information materials registering their surprise at quite how stark the UK poverty statistics or reality actually are. There is also some anecdotal evidence of information-sharing about UK poverty triggering individuals into wanting to do something about it, in particular donating. There is far less (anecdotal) evidence about information-sharing *alone* directly leading to increased support for the UK poverty agenda, for specific policy measures in favour of

people on low income or for a change in attitudes towards them.

Getting individuals to act

The research has explored a range of campaigns focusing on particular (policy) measures in favour of people on low income, such as increases in wage, benefit or support levels. The primary aim of most of these campaigns tends to be achieving policy change rather than addressing public attitudes. The public engagement component of the campaigns often focuses on demonstrating rather than building public support in order to put additional pressure on politicians. The public engagement strategies of these campaigns can reach fairly large groups of people who are willing to register their support for the campaign and of people who are willing to take direct action – typically a few hundred to a few thousand people. Even larger audiences are being reached through media coverage for the campaigns. Perhaps somewhat unexpectedly, several of these campaigns are relatively effective in reaching out beyond the usual suspects – signing up supporters outside their existing donor base or getting the campaign message across to people who were not previously aware of the particular injustice the campaign is fighting. There is clear anecdotal evidence of audiences getting in touch with the campaigns to register their surprise or outrage at finding out quite how low benefit, wage or support levels are, or quite how stark the reality is for a particular sub-group of people on low income.

Increased awareness-raising does not automatically lead to increased support for anti-poverty action. However, unlike the first group of initiatives (which are about *informing* people about UK poverty and what it means to live in poverty), information-sharing in a campaign context offers a possible *outlet* for the surprise that people might

feel when discovering poverty facts. This gives people who wish to do so a direct chance to show their support. Moreover, the specificity of the campaigns and their focus on absurd situations of systemic injustice means that audience reactions are more likely to go beyond surprise and register levels of shock or outrage. Nevertheless, because of their focus on people living in poverty for whom the public is perceived as having more sympathy (such as working people on low incomes or children) and because they avoid messaging that suggests that the interests of the audiences and the interests of people on low income may not coincide, these campaigns do not necessarily build any public support for more unpopular anti-poverty measures. There is very little or no evidence of individuals who were initially opposed to a particular policy measure but changed their opinion as a result of an advocacy campaign. By and large, advocacy campaigns build support by alerting the public to *hidden* issues, rather than tackling *controversial* ones.

There is fairly strong evidence about the value of volunteering as a way to provide direct contact between people on low and higher incomes. Volunteering with people on low income in their own communities is arguably the most direct way to experience the power of real-life stories, making volunteers realise that poverty is not just about money but also about the experience of living in poverty.

Getting organisations to put poverty higher on the agenda

Finally, the research identified a range of successful initiatives focusing more generally on getting poverty higher on the political agenda or the agenda of other (mainly public sector) organisations. This often includes an element of awareness-raising among the organisations' staff. Unlike advocacy campaigns that tend to focus on highly specific policy asks, these activities are more generically trying to get organisations to consider a range of mechanisms and approaches all aimed at tackling UK poverty. Approaches include the development of anti-poverty strategies or anti-poverty toolkits, the drafting of anti-poverty challenge documents and the introduction of a dedicated member of staff, unit, agency or

external actor as an anti-poverty advocate. The overall impression created by these initiatives is that they can indeed have a fairly strong mobilising effect and can be quite effective in creating a certain 'buzz' and 'noise' around UK poverty. These initiatives often succeed in reaching beyond the usual suspects, in particular because many explicitly set out to reach departments, organisations or colleagues who may not initially think that they have a remit for tackling UK poverty. The 'weakness' of these initiatives in the context of this research is that they rarely have a strong public engagement component and as such do little to build support for UK action among the 'wider' public. Some initiatives succeed in generating significant media coverage for key milestones (such as the launch of a strategy or a challenge document). However, there was far less if any anecdotal feedback about readers or viewers reacting to this kind of media coverage.

What works?

The first step when trying to build public support for the UK poverty agenda is outreach and engagement – catching the attention of the audience. It is at this stage that use of the term 'poverty' can be problematic. 'Poverty' does not 'capture' audiences (other than UK poverty stakeholders) because individuals tend not to understand its relevance to the UK, to their jobs or to their lives. This means that audience engagement on UK poverty needs to happen:

- through stealth – hiding the poverty message in a format that does not at first appear to have anything to do with UK poverty, such as a tabloid-style free newspaper celebrating diversity that targets London commuters, reality television or leaflets mainly talking about international poverty;
- focusing on a more specific UK poverty-related issue that people find easier to understand and relate to, such as wage levels, debt or homelessness;
- using a champion – identify someone who is passionate about and committed to tackling

UK poverty, and is willing and able to convince colleagues, family or friends to engage with the UK poverty agenda.

The most effective mechanisms of outreach beyond the usual suspects, appear to be the following.

- To have a clear targeting strategy – organising events that are open to the ‘wider public’ or leaving information materials for the ‘wider public’ to pick up is likely to attract mainly people who are already interested in the topic. Targeting specific groups, not on the basis of their attitudes towards UK poverty, but on a particular interest or activity that they have in common (for example, social workers, employees in one specific company, London commuters, cinema-goers, football fans) can often offer an opportunity to engage people with varying initial levels of awareness, understanding, interest or support for the UK poverty agenda.
- To undertake *proactive* outreach – going out to the target audience rather than waiting for the target audience to discover the campaign, the materials or activities that are taking place; and generally making it easy for individuals to engage.
- To use a mix of different engagement mechanisms linking them to the different target audiences one is hoping to reach. Developing materials (leaflets, YouTube videos, a website) or setting up events does not, on its own, engage audiences. They have to be made aware and interested in the materials or events. Techniques as varied as YouTube or Google ads, lesson plans for schools and offering free thermometers in return for engagement can be effective in encouraging audience involvement.
- The importance of media coverage in reaching out to audiences appears to be confirmed by the research findings, although again the message seems to be that clear targeting and trying to go beyond broadsheet coverage (through channels as diverse as daytime

television, tabloid press or sports radio channels) can be effective.

- There is some limited evidence that social networking sites such as Facebook can see the fan base for particular charities grow quite rapidly. However, total numbers of fans for UK poverty-related campaign Facebook sites appear to be fairly modest and not to achieve more than more traditional website-based engagement tools (such as online petitions).
- Partnership working is yet another way of achieving broader audience reach, as partners’ supporters or members can be brought into play.

The budget that is available for the activity does not dictate how many individuals will be reached. There are examples of resource-poor activities or campaigns (even activities run entirely on a voluntary basis) reaching significant numbers. However, the opportunity cost of individuals giving up their spare time must be taken into consideration. Moreover, there does appear to be a link between financial and staff resources available and the width of the engagement mechanisms that are being used – more resources enable organisations to experiment with more varied outreach techniques.

The second step, once organisations have succeeded in capturing the audience’s attention, is making sure that the UK poverty message gets across.

- By and large, the research confirms the power of real-life case studies. There was consistent if anecdotal evidence from the vast majority of stakeholders interviewed that real-life stories often lead to surprise and sometimes shock or outrage about how widespread or challenging living in poverty is; it may also lead to donations. Statistics may similarly surprise people but do not elicit the same emotion in reactions and may not be remembered. When targeting decision-makers (officials, politicians), real-life stories may strengthen their resolve to take action against poverty or even possibly change their position about the value of a

particular policy measure. Real-life stories do not, however, on their own appear to build support for specific policy measures among the wider public. There is very little if any anecdotal evidence of individuals who initially were against a particular policy measure and changed their views as a result of a story.

- There is a clear need to unpack what ‘poverty’ means. The messenger needs to make poverty relevant and give examples of the implications of poverty for daily life to make the audience *understand* poverty. Use of budget tools, where the audience is asked to make the kind of budget-allocation decisions a person living in poverty would be expected to make, can be effective. The audience almost inevitably decides that the income that is available is not sufficient to meet daily needs. Showing that people living in poverty are not different from people who are better off can be quite effective. However self-evident it may seem that people on either side of the poverty line are fundamentally the same, there does appear to be a tendency to forget this and reconnecting audiences with this truth is necessary. In the context of organisational engagement, starting from the organisation’s remit and priorities, and showing how the poverty agenda links with this remit appears to be the way forward.
- Specific messaging about a specific problem with a clear solution works – audiences want to see that the problem can be solved and want to be part of something that will (potentially) lead to a positive outcome. Messages about injustices that are so obvious that they do not need to be spelled out are particularly effective. Messages about people on low income for whom the public is perceived to have more sympathy – children, people in work – are easier to sell, especially when these people can be cast against a ‘villain’ such as an unfair employer. There is no evidence, however, that support for these messages also builds support for more unpopular policy measures for other sub-groups of people living in poverty.
- As with all communication, the message will get across more effectively if the messenger is

someone people trust and whose opinion they respect. Support for the message becomes the social norm and the expected behaviour. What this means in practice, however, can vary.

- Messaging that does not undermine the audience’s own interest or, better still, anti-poverty proposals that are also likely to benefit the audience appear to be significantly more likely to be heard. This presents UK poverty stakeholders with a tricky dilemma. Some of the more unpopular messages are arguably the ones where most activity is required; however, these messages are perceived as going against the interest or values of audiences.
- Similarly, approaches that do not make the audience feel personally responsible or guilty appear to be preferable – although the message about the reality of poverty needs to get across, this can be done without preaching and generally keeping things enjoyable. Surprisingly, despite the broad consensus about the importance of keeping a positive slant on things, a lot of the information-sharing about poverty including stories, focuses on presenting the *hardship* of living in poverty rather than success stories of overcoming poverty.

Recommendations

The research formulates a number of recommendations, including the following.

- Suggestions for the Government to pay close attention to its (implicit) messaging on UK poverty. Benefit-awareness campaigns, campaigns alerting workers to their wage entitlements and campaigns to counter stigma and discrimination of people on low incomes send out the message that people living in poverty are worthy of, and have the right to, support and sympathy.
- Suggestions for the Government to consider funding elements of UK poverty activity that have the potential to build public support but do not undermine the independence of the voluntary sector advocacy campaigns, such

as poverty-awareness training, empowerment of people living in poverty, the promotion of volunteering opportunities in deprived areas, possibly core funding for the different anti-poverty networks and funding to help track and monitor achievements, such as, for example, subsidies to cover the cost of subscription to the Charity Awareness Monitor for smaller organisations.

- Suggestions for the voluntary sector to consider argumentation based on countering the *valid* concerns and claims of people who are not unequivocally in favour of an increase in wage, support or benefit levels – rather than dismissing these concerns as stereotypical discourse from individuals who do not realise what it is like to live on benefit or on the minimum wage.
- Suggestions for the voluntary sector to consider more opportunities for joint working. There appears to be particular scope for strengthening collaboration between, on the one hand, the different anti-poverty networks and, on the other hand, the voluntary sector organisations engaged in campaigning on specific policy issues and specific target groups. The success of issue-specific campaigns lies in their reach (often several thousand individuals); the added value of a lot of the work of the anti-poverty networks lies in their depth (going beyond the sub-groups of people on low income for whom the public is perceived to have more sympathy and being able to unearth and challenge negative attitudes towards people living in poverty).
- Suggestions for funders to encourage charities to be more explicit about the aims and objectives of the public engagement components of their campaigns and to no longer accept vague references to raising ‘public’ ‘awareness’ or challenging ‘public’ ‘attitudes’. Funders can challenge charities into specifying whether they are trying to *demonstrate* or *build* support – if *demonstrating* support, the number reached may arguably be the most important indicator; if *building* support, funders can encourage

charities to specify whether they are addressing perceptions, attitudes or behaviour and exactly which perceptions, attitudes or behaviours they will tackle and how.

- Finally, suggestions for funders to put in place the tracking and monitoring mechanisms required to evidence outputs or intermediary outcomes, either by directly providing financial support for the tracking and monitoring mechanisms to be put in place or by guiding charities to free-access monitoring mechanisms available. Similarly, funders may wish to invest (more) in capacity-building around evaluation for the third sector. Many funders, to their credit, are placing a strong focus on evaluation. However, all too often, evaluation is interpreted by organisations as an afterthought, built on the basis of data and findings that happen to be available when the frantic campaigning activity has come to an end and overworked staff are finally allowed some time to take a step back to consider their achievements. Placing a stronger focus on *monitoring* mechanisms may well be one small element that can support the cultural change required to get charity staff to think about effectiveness and impacts throughout the lifetime of an activity. Funders are also encouraged to be realistic in their expectations of what can be achieved in terms of building public support for the UK poverty agenda within short timetables. In some cases, succeeding in engaging people in a dialogue about controversial issues, irrespective of any outcomes of this dialogue, might well need to be considered an important achievement. This report also provides funders with some preliminary benchmarks around what can reasonably be expected of campaigns in terms of supporter reach.

1 Introduction

Background to the research

This research is part of the Public Interest in Poverty Issues (PIPI) programme, which is managed and funded by the Joseph Rowntree Foundation (JRF). PIPI starts from the premise that public support for the UK poverty agenda is necessary to ensure and sustain action by the Government and others to tackle poverty in the UK.

The overall aim of this research was to identify approaches and strategies that are successful in building public support for addressing UK poverty. The main research questions were the following.

- To what extent and how are organisations trying to build public support for addressing UK poverty?
- To what extent and how are they measuring whether their attempts are successful?
- What can we say about what ‘works’ in trying to build public support for addressing UK poverty – and what is the evidence base for this?

The research builds on other PIPI research, in particular a series of focus groups undertaken by Ipsos MORI aimed at exploring a number of different scenarios and mechanisms to engage audiences with the UK poverty agenda.¹

What is meant by ‘building public support’?

More than a quarter of the British public think that people living in poverty have only their own laziness or lack of willpower to blame. Another third of the population think that poverty is just an inevitable part of modern life.² Moreover, people are uncomfortable talking about UK poverty and

are unfamiliar with the terms of the debate. For most, the default association with poverty is the absolute poverty experienced in developing countries or the poverty found in Britain in Victorian times.³

Against this background, building public support requires bringing more people into an informed and constructive *debate* about UK poverty – giving them a better understanding of what being poor in modern-day Britain means and challenging their view that poverty is the result of laziness or just an inevitable part of life. A second aspect to building public support is encouraging more people to *act* on UK poverty.

Traditional voluntary sector ‘campaigns’, typically a combination of political lobbying, media work and popular mobilisation activities, are one possible mechanism of engaging the public with the UK poverty agenda and this type of activity is included in the research. The report does not look at the effectiveness of these campaigns in achieving policy change – the focus is on obtaining public *support* for action on poverty rather than the action of tackling poverty itself. The research also explores other mechanisms and activities by actors outside the voluntary sector.

The challenge of building public support for addressing UK poverty

UK poverty is a particularly challenging issue to work on. In other areas of social marketing it is fairly self-evident what audiences are asked to support – for example, anti-smoking legislation or healthier school dinners. It is not immediately clear what one signs up to when agreeing to support action to address UK poverty. It would arguably be difficult to find anyone who would be against tackling poverty. However, explanations of why poverty exists persist and its solutions are contested and political. A recent research report⁴ makes a distinction between campaigning on

valence and *position* issues. Valence issues refer to common values for which there is broad societal consent, such as peace or the environment. Position issues are topics on which groups in society can hold contrary positions (such as abortion). What arguably makes building public support for addressing UK poverty particularly complex is that UK poverty is both a valence issue (there is broad societal agreement that poverty is a bad thing) and a position issue (there are, for example, different opinions in society about benefit levels and also about the causes of and solutions for poverty).

Moreover, achieving *attitudinal* change is difficult and time consuming. There are limits to the attitudinal change any (voluntary) organisation can achieve on its own, in particular given the limited availability of funding for campaigning activities and the short time-frames of most funding streams. Most donors interviewed for this research, struggled to give examples of funding public support building activities in the field of UK poverty, pointing to the relative scarcity of applications in this field but also to their trustees' reluctance to get involved in activities where outcomes are difficult to measure or even simply difficult to achieve. A recent research report⁵ similarly comments that donors and funders are hesitant to support campaigning.

Finally, the stigma of the poverty label means that people on low income themselves often do not wish to be associated with it, further complicating the challenge. Researchers recall how a focus group participant realised that she was technically well below the poverty line when she heard the formal UK poverty definition but staunchly denied that this was a description of herself.⁶ UK poverty stakeholders similarly gave anecdotal evidence of individuals' reluctance to accept the poverty label.

What this research is and what it is not

Many other researchers have developed guides on effective campaigning and on how to evaluate social marketing activities.⁷ This report is not yet another good practice guide on campaigning or measuring effectiveness. It aims to build on

what others have done by starting from what is happening on the ground (as opposed to what *should* be happening) and what this tells us about the effectiveness of different approaches.

The report does not linger on the absence of hard evidence of impacts. The lack of hard evidence is unfortunate and widespread. However, the lack of evidence is the starting point for the research, not its conclusion. This report, while fully and explicitly acknowledging the limitations of its evidence base, makes no apologies for it. The report presents a catalogue of the available hard data, anecdotal evidence and staff insights on impacts and effectiveness of activities aimed at building support for the UK poverty agenda. It offers a number of preliminary conclusions around what 'works' and invites other stakeholders to further build on these hypotheses.

The research team did not undertake any primary evaluation research. All evidence presented in the report is evidence provided by the host organisations.

Structure of the report

The next chapter presents an overview of public support building activities currently taking place in the area of UK poverty. Chapter 3 looks at whether and how UK poverty stakeholders are measuring and evidencing the effectiveness of their activities. Chapter 4 briefly explores the theory of change that underpins the support building activities, assessing what is being achieved in terms of altering perceptions, attitudes and behaviour. Chapter 5 presents the research findings around what 'works' in building support for the UK poverty agenda. The final chapter concludes. The appendices present information about the research methodology (Appendix 1) and an overview of the 29 case studies that formed the basis of this report (Appendix 2). Appendix 2 is meant as a reference tool, presenting readers with the option to find out more about a particular case study mentioned in the report that they may be particularly interested in.

2 Mapping: who is doing what?

Perhaps unsurprisingly given the challenges involved in engaging the public with the UK poverty agenda, the research found relatively few examples of activity *explicitly* aimed at building public support with the UK poverty agenda. By and large, the focus of the voluntary and community sector is on lobbying policy-makers to achieve policy change and on empowering people experiencing poverty. Public and private sector organisations typically focus on attempting to improve the lives of people on low income rather than building support for anti-poverty action. Research institutes interpret their own activities in terms of researching poverty rather than explicitly aiming to build public support for the UK poverty agenda.

That being said, the research identified three categories of activities that are currently taking place and can, broadly speaking, be considered to fall under the heading of building public support for tackling UK poverty. They are activities focusing on:

- informing the British public about the prevalence of poverty in the UK and about what it means to live in poverty – this includes methods of one-way information-sharing (for example, through leaflets) and more interactive engagement mechanisms;
- getting individual members of the British public to do something;
- getting organisations to put poverty higher on their agenda – this typically includes building staff members' awareness and understanding of the UK poverty agenda.

Informing people about UK poverty

One can reasonably argue that all UK poverty stakeholders are involved in providing their audiences with information on UK poverty in

one form or other. However, in some cases, the information-sharing is the main focus of the activity. Audiences are not asked to do anything with the information that is presented to them, they are (only) challenged into becoming more aware of UK poverty and into changing their perceptions about what it means to live in poverty.

A number of different approaches are being used.¹

- Research on the prevalence of poverty in the UK and on what it means to live in poverty. For example, the New Policy Institute Poverty website aims to provide a comprehensive and up-to-date overview of officially available statistical information relating to UK poverty. The *Living with Hardship 24/7* research report explores the challenge of living and parenting on a low income.
- Production and dissemination of information materials about UK poverty, ranging from traditional printed leaflets to electronic newsletters and use of new media such as YouTube videos. Examples include *The New Londoners* newspaper, the Islamic Aid annual brochure and Oxfam's YouTube videos on UK poverty.
- Television programmes that have the potential (if not necessarily always the explicit objective) to inform people about what it means to be poor in the UK, such as *Evicted*, *The Secret Millionaire* or the *Spotlight Life Swap: Diamonds and Dole* documentary. Comic Relief has in the past broadcasted short videos about poverty-related issues (in particular homelessness) during the biennial Comic Relief BBC television show.
- The organisation of events where members of the public are invited to discuss, learn about or

even directly ‘experience’ poverty – this often involves direct contact with people living in poverty. One example is the workshops and sleeping rough events organised in the context of the Poverty and Homelessness Action Week.

- Poverty-awareness training events – these are particular types of events that more formally educate people about the prevalence of poverty in the UK and what it means to be poor. A number of different techniques are used, including statistics and research, real-life stories about poverty, video material presenting the perspective of people living in poverty, a ‘poverty trap’ game along the lines of snakes and ladders demonstrating the difficulties of escaping poverty and a ‘poverty budget’ tool asking training participants to make budget-allocation decisions that a person living in poverty might need to make. Poverty-awareness training activities are organised or facilitated by voluntary sector organisations (such as Poverty Alliance and the Northern Ireland Anti-Poverty Network), but also by companies (for example, the Gateshead Housing Company), academics (for example, King’s College London) and local authorities (for example, Dundee Council, which has developed a poverty-awareness training DVD).

Encouraging individuals to act on UK poverty

The research also came across a range of initiatives focusing on encouraging individual members of the public to personally do something about poverty in the UK. This can take the form of *volunteering* in deprived communities organised by voluntary sector organisations (examples include the Dare to Care campaign and the Christians against Poverty volunteer centres) or by private sector companies (examples include Business in the Community’s Business against Homeless programme and the Fit4Finance financial education offered by branches of the Britannia Building Society).²

Individuals can also get involved in *activism*,³ demonstrating their support for anti-poverty action by various means, including the following.

- Wearing or displaying a sign of support (such as displaying an Anti-Water Tax campaign car sticker).
- Signing a petition – more innovative methods include collecting photographs of supporters instead of signatures (as in Shelter’s One Million Children campaign) or encouraging people to write a personal message rather than merely leaving their signature (as on the End Child Poverty website, which gives people the opportunity to enter a virtual march, carrying a banner with their own support message).
- Sending an email or letter to their MP, another politician or to the company whose policies need changing (as in Refugee Action’s Destitution campaign).
- Attending a rally or event – a recent example is the October 2008 End Child Poverty rally in Trafalgar Square. The Northern Ireland Anti-Poverty Network (NIAPN) Anti-Water Charges campaign similarly mobilised people to demonstrate outside the Northern Ireland Assembly in Stormont.
- No longer buying products or services from companies that have been exposed as exploiting their staff. The threat of a boycott is often implied rather than real – the focus tends to be on generating negative publicity for a company rather than explicitly asking the wider public to take their custom elsewhere. Campaigners adopt a ‘name-and-shame’ approach. Examples include the London Living Wage campaigns and the Daily Mirror’s Fair Tipping campaign.

There are also a series of actions targeting people living in poverty or at risk of poverty, encouraging them to try helping themselves. By being public campaigns or having a public engagement element, these actions may also have a positive impact on broader public awareness of poverty, causes and entitlements.⁴

- Benefit-entitlement campaigns, aimed at increasing benefit take-up and people’s awareness about the benefits they are entitled

to – examples include the annual Help the Aged Winter Deaths campaign and the large-scale and successful initiative currently run by Devon County Council.

- Campaigns to warn people at risk of or living in poverty against exploitation or the poverty trap. For example, the Scottish Government commissioned Poverty Alliance to run a poster campaign alerting migrant workers to their statutory rights. The Loan Shark campaign warns people on low income against the risk of spiralling debt when accepting a loan from a doorstep lender. The Gateshead Housing Company runs information sessions for new tenants on financial management to prevent tenants from falling into arrears.
- People living in poverty are being offered pre-employment or employment opportunities. Employment support covers a vast area of activity; directly relevant for this research are initiatives where people in poverty are given opportunities to share their life stories with the company's staff or customer base. Arguably the clearest example is *The Big Issue*, a magazine sold on the street by homeless people.

Encouraging organisations to put UK poverty higher on the agenda

A third broad category of activities focuses on encouraging governments, departments, agencies and other organisations to put UK poverty higher on their agendas. These initiatives are not championing one particular policy or demanding attention for one specific problem, but are trying to convince colleagues and partners at a more general level that poverty (or child poverty or rural poverty) in the UK is real and relevant for their organisations.

This is mainly the domain of public sector stakeholders involved in the UK poverty agenda. Different mechanisms and approaches are used.⁵

- The development of anti-poverty strategies – at local level (such as in Dundee, Bedfordshire and Stockport), at national level (such as the

Scottish Tackling Poverty strategy) or even in the context of a private sector company (such as the Gateshead Housing Company Anti-Poverty Strategy).

- The development and promotion of 'toolkits' to show organisations how they can take the poverty agenda forward in their own organisation. Examples include the Government of Ireland's Poverty Impact Assessment tool, the Wales Child Poverty Solutions online toolkit and the online Child Poverty Toolkit developed by the Child Poverty Action Group and the Centre for Economic and Social Inclusion. A poverty toolkit is being planned in the Borders; similarly, the Scottish Government's Tackling Poverty Framework announced the development of an online poverty toolkit in 2009.
- The development of 'challenge' documents – these documents are based on (local) research and consultation, but, unlike traditional research reports, they have the explicit aim of trying to challenge people into putting poverty higher on the political agenda. The documents are sometimes the work of poverty 'commissions', bodies bringing together stakeholders from different backgrounds to investigate poverty and challenge organisations into taking action. Examples include the challenge document produced by the Borders Poverty Commission and the Capital Gains report produced by the London Child Poverty Commission.
- The introduction of an (external) advocacy role – where an organisation, unit or individual member of staff acts as an advocate for people living in poverty. The role of advocate involves going out to colleagues and partners to inform them about what it means to live in poverty, to explain how poverty is related to their organisation's remit and encourage them to put poverty higher on their list of priorities. This can take a number of different formats including: a designated poverty or child poverty officer in a local authority; the advocacy undertaken by the Department for Work and Pensions

(DWP)/Department for Children, Schools and Families (DCSF) Child Poverty Unit and the Commission for Rural Communities; voluntary sector advocacy campaigns such as the Get Fair campaign and the Campaign to End Child Poverty. These voluntary sector campaigns are different from more traditional campaigns in that they approach poverty (or child poverty) in a more general and comprehensive way, rather than focusing on one specific policy ask.

3 Evidencing effectiveness

The challenge of evidencing effectiveness

Evidencing the effectiveness of public support building activities in the field of UK poverty is challenging. First, there are a number of methodological constraints. Large-scale surveys of people's views on UK poverty can and do take place. However, they are costly and tend not to be linked directly to particular campaign publications or activities, making 'attribution' of impacts problematic – how can an organisation know that it is its activities that have made a difference? Organisations can use feedback forms or organise email surveys of their members to assess impacts, but these exercises reach only a particular subset of individuals and there are obvious difficulties in extrapolating findings for an organisation's membership to the wider population. Moreover, measuring an increase in knowledge or a change in behaviour may be fairly straightforward; detecting a change in attitude is more complex. Measuring the sustainability of a change in perceptions, attitudes or behaviour is arguably even more challenging.

A second barrier is resource constraints. Budgetary constraints may make the commissioning of an external evaluation difficult; limited staff resources mean not enough time is available in-house to invest in designing questionnaires or feedback forms and in collecting, collating and analysing responses.

It can be argued, however, that organisational culture is at least as important as the availability of resources or methodological constraints.¹ The research came across a number of examples where UK poverty stakeholders, including small and resource-poor voluntary sector organisations, were trying to systematically collect and collate evidence in-house, using very little if any additional resources. For example, organisations showed the research team examples of simple Excel sheets giving an overview of media coverage or Word

documents that presented an overview of partner or audience feedback, often simply cutting and pasting email content. Others explained how they used free-access online monitoring methods. This shows that, even in a resource-poor environment, monitoring and evaluation is possible.

Extent of evaluation activity

The research found few examples of formal impact assessments of support building activities in the field of UK poverty. Quite a few reports were notified to the research team as 'evaluation' reports, but most of these documents presented a summary of event proceedings with a limited number of conclusions regarding the process of organising the event, rather than any attempt to identify impacts on event participants. Outside the voluntary sector, relevant evaluation reports were even scarcer.

Case studies: formal impact assessments

The research looked at five examples of formal evaluations.

- A full-scale external evaluation of the work (including the impacts) of the Commission for Rural Communities (CRC) undertaken in 2007 – this involved a stakeholder survey to get stakeholders' views about the strengths and weaknesses and impacts of the CRC to date; a limited number of focus groups were held as well to get the views of the wider public.
- An external evaluation report of the poverty-awareness training undertaken by the Northern Ireland Anti-Poverty Network and Save the Children – using evaluation booklets, feedback forms and focus groups with training participants.

- An internal evaluation by Help the Aged of the Winter Deaths campaign – using supporter survey responses and an analysis of the reactions received by DWP as a result of the GMTV Winter Deaths campaign.
- An in-house evaluation by Shelter of the One Million Children campaign – pulling together evidence and data from a range of sources, including MORI polling and market research, staff perceptions, media tracking, monitoring of supporter engagement and activity, focus groups with campaign supporters and feedback from politicians and other stakeholders.
- An internal evaluation by Community Service Volunteers (CSV) of the Dare to Care campaign – based on a detailed survey of participants, identifying participant characteristics and their attitudes to volunteering before and after the volunteering activity; media tracking and analysis, and feedback from partners.

That being said, most if not all organisations hold some evaluation evidence, which tends to be either:

- output data such as attendance figures, or intermediary outcomes such as media coverage – often based on fairly systematic and comprehensive tracking; or
- anecdotal evidence about impacts – in the vast majority of cases unrecorded and only identified by asking interviewees about their evidence for particular statements around what ‘works’.

In terms of impact assessment, then, the challenge is not so much that the information is not there, but that it is not easily accessible or collatable and risks disappearing when the member of staff involved leaves the organisation.

Nature of evaluation activity

Market research and developing baselines

There were a number of examples of organisations trying to develop market intelligence on public attitudes towards UK poverty. This was mainly the case among larger organisations. Organisations commented that they tried staying informed about existing research on public attitudes towards UK poverty.² In a limited number of cases, organisations undertook their own primary research on public attitudes. For example, the Get Fair campaign recently inserted a question about public support for political action on UK poverty in a YouGov poll.

In most cases, market research is done with the objective of putting pressure on politicians, improving fundraising or sales, or understanding what might work in a new campaign – rather than explicitly developing a baseline against which impacts can be measured at a later stage. For example, Poverty Alliance undertook an interesting piece of research with their members, local authorities and others to test market demand for additional poverty-awareness training – discovering that there was some demand for additional training but that this demand would not bring in enough revenue to pay for an additional member of staff.

Examples of development of campaign baselines are rare and the few examples that could be identified tend to focus on baselining exercises for specific events rather than a more strategic campaign baseline. The research did, however, come across an interesting example of a charity using MORI polling to compare the percentage of the British public who were aware of one of their key campaign messages (a key statistic on UK poverty) before and after their two-year campaign.³

Case study: baselines

The research came across a limited number of examples of organisations developing baselines for their activities.

- The external evaluation of the Northern Ireland Anti-Poverty Network’s Poverty Awareness Programme used participant questionnaires. These compared participants’ knowledge and confidence to

talk about poverty before and after training sessions. Participants were recontacted three months later to discuss longer-term impacts.

- The Dare to Care campaign, which aimed to encourage individuals to take up volunteering to contribute to ending child poverty, tested whether attitudes or knowledge on child poverty had changed by asking volunteers identical questions before and after their volunteering experience.

An interesting example of market research is the *Charity Awareness Monitor*, to which a number of larger charities are subscribed. The Monitor allows charities to include their name as well as the name of a campaign in an annual representative opinion poll, enabling them to compare name recognition of their organisation and campaigns with that of others and any changes over time.

Monitoring supporter/participant characteristics, activity and feedback

Most voluntary sector campaigns have clear policy asks but surprisingly many are vague on the numbers and types of people they are aiming to reach. There are some interesting examples of organisations trying to better understand or segment their target audiences, but they are not directly linked to building public support or to the UK poverty agenda.⁴

Similarly, relatively few voluntary sector organisations have a clear understanding of the audiences they do reach. Organisations often collect participant/supporter contact details but rarely ask for more detailed information.

Examples of identifying support characteristics

- One children's charity mentioned a tick-box option for supporters younger than 18, enabling them to assess the number of under-18s in their supporters' base.
- Some petitions ask signatories for their postcode.

- Shelter has developed comprehensive monitoring data on its supporters in terms of both personal characteristics and the extent of their involvement. This allows for later identification and prioritisation of recruitment mechanisms that are most likely to attract active supporters.
- Dare to Care similarly collected detailed information on supporters, mainly via local partners.

Many organisations attempt to track their supporters' involvement in a particular campaign. Organisations mentioned use of online tracking software⁵ to monitor e-campaigning action – for example, tracking how many individuals had opened their electronic newsletter or responded to their request to email their MP. Other organisations had set up an internal logbook to encourage their staff to log achievements or had involved their interns or volunteers in chasing activists for information on what they had done locally. Some organisations kept track of the number of campaign materials requested by the public or campaign activists. Organisations tend to monitor the number of individuals registered as supporters or who have subscribed to their electronic newsletter. In several cases, information about numbers reached is posted on the website to demonstrate success.

Case study example: Poverty and Homelessness Action Week

The first Poverty and Homelessness Action Week was organised in 2008 by Church Action on Poverty. The campaign aimed to encourage grass-roots activists to develop their own local poverty-related events. To find out what is happening on the ground, Church Action on Poverty includes a form to log activities in the campaign pack. It asked a number of volunteers to call local activists to encourage them to return the forms.

A significant number of organisations monitor online traffic on their websites, in some cases including fairly detailed information about

unique visitors, which pages were visited, which documents were downloaded and how long visitors stayed on the site. Organisations using new media try to keep track of the number of viewings of their YouTube videos, visits to their blog pages, subscribers to their RSS feeds or members of their Facebook sites, but further analysis beyond numbers reached is rare. The Dare to Care campaign is an interesting exception. The campaign organised a survey of its Facebook site members, resulting in detailed information about whether they had also visited the Dare to Care website or had encouraged others to sign up to the Facebook site. Commentaries on blogs, potentially a rich source of anecdotal feedback of impacts and reactions (if not necessarily from a representative sample), tend to receive only very partial analysis.

Some (larger) organisations set up focus groups with their supporters' base – to test reactions to fundraising techniques or campaigning messaging, or to understand why someone no longer supported a particular organisation or campaign.

Case study: *The Big Issue*

The Big Issue street newspaper is published on behalf of and sold by homeless people with the objective to highlight issues around homelessness. *The Big Issue* uses market intelligence to better understand why someone no longer buys a magazine and to test public understanding of *The Big Issue* and homelessness in the UK. The company buys in services from a marketing company to undertake focus groups of *The Big Issue* readers and donors.

In a limited number of instances, organisations use feedback forms to get participants' views about a particular event and, in some cases, about the event's impact on their knowledge or views about poverty. This tends to happen, for example, in the context of poverty-awareness training events. Perhaps surprisingly, few if any organisations indicated that they were using free-access online survey software, which would bring participant survey within easy reach of most voluntary sector organisations.⁶

Case Study: Seeing is Believing

Business in the Community's The Prince's Seeing is Believing programme invites senior business leaders to see for themselves how business can play a role in tackling Britain's most pressing social issues. After a visit to a deprived area, each participant is asked to write a detailed report on what they have learnt and consider what their business can do to tackle some of the most pressing social issues. The feedback form also includes questions about possible changes in attitudes and behaviour as a result of what they had experienced through the programme.

A limited number of organisations reported collecting and collating unsolicited and informal feedback about their awareness-raising activities from the wider public (such as letters to the editor following their own letter to the editor) – in some cases proving that monitoring impacts is also possible in situations of severe resource constraints. Most organisations, however, only recalled the anecdotal feedback when they were explicitly asked for this evidence by the research team and did not have any *record* of the feedback.

Case study: *The New Londoners* newspaper

The New Londoners newspaper is produced by refugees and asylum-seekers and aims to present a positive portrait of them. Following publication, the Migrants Resource Centre, which supports the production of the newsletter, receives a number of reactions by letter, email, telephone and from people walking in. Some of the feedback is collated into a simple Word document, presenting a snapshot of some readers' reactions.

Tracking media coverage

Media tracking appears to be relatively widespread across voluntary, private and public sector organisations and is done either in-house (ad hoc, as and when staff come across a reference or through more systematic use of the Google news search engine) or by a professional media tracking

company. This includes both simple monitoring of coverage and sophisticated analysis including a review of the readership for a particular article, using 'weighted opportunity to see' analysis – also looking at the tone of the article.

Case study: *Living with Hardship 24/7*

The November 2007 report *Living with Hardship 24/7* presents the findings of research that explored the relationship between living on a low income and parenting. The National Society for the Prevention of Cruelty against Children developed a simple overview document, not only recording references to the publication in the media, but also tracking radio interviews, shorter articles about the report written by the organisation and presentations about the report by the organisation. Although not necessarily comprehensive, it presents a useful overview of the reach of the dissemination.

Parliamentary and policy monitoring

A few (predominantly larger) organisations are signed up to the *Charity Parliamentary Monitor*, which monitors mentions of an organisation or a campaign in the Houses of Parliament. Others undertake this type of policy monitoring in-house. The Give Me Five campaign described how it monitored parliamentary activity by logging into a free-access parliamentary monitoring site every day and did a quick wordsearch of the parliamentary debate of that day.

Organisations also pointed to anecdotal feedback from politicians or officials, or to quotes from politicians in the media about the campaign or activity. An interesting example is feedback from decision-makers on the One Million Children campaign. They found that the campaign had been effective in making bad housing and homelessness a greater public priority, even if polling data does not necessarily support this observation. In some cases these quotes or reactions from politicians were recorded either as posts on the website (to highlight success) or as part of internal strategy documents to discuss tactics and next stages.

Informal debriefing and partner feedback

By and large, the most used method to assess effectiveness is to simply conduct informal debriefings at the end of an activity or campaign. This was reported particularly where an activity was carried out by a partnership. Organisations also referred to partner feedback by email, telephone or face to face. For example, the Campaign to End Child Poverty was able to present the research team with a series of unprompted congratulatory emails from members of the End Child Poverty coalition network, commenting about the success of the October 2008 End Child Poverty rally. However, partner feedback is rarely collated and thus is difficult to analyse or use.

Way forward?

Collectively, UK poverty stakeholders were able to present a significant number of interesting and sometimes innovative approaches to trying to research and evaluate their activities. The central challenge appears to be twofold: very little activity focuses on assessing *impacts* (as opposed to outputs or intermediary outcomes) and, where anecdotal evidence of impacts is available, it is rarely systematically collated.

The first step towards a clearer focus on assessing impacts is being clear about objectives. When considering indicators to measure effectiveness of public awareness-raising, it is important to specify whether the activity is trying to *demonstrate* or *build support*.

If *demonstrating* support, numbers reached may arguably be the most important indicator. In that case, organisations can and in many cases already are evidencing success by tracking supporters' involvement and looking at website traffic.

If *building* support, it is necessary to specify who the target audiences are and whether the activity is challenging perceptions, attitudes or behaviour. The way forward appears to be investing more in collection and collation of feedback of participants or audiences, anecdotally or otherwise (through feedback forms, email or telephone surveys) – testing individuals' starting positions and any changes from this baseline. This

implies that organisers and funders must allow sufficient (financial or staff) resources for this type of activity, including if and when capacity-building support is necessary.

4 What do these activities achieve?

Theory of change

When assessing the achievements of UK poverty-related activities, it is useful to make a distinction between success in changing perceptions (or raising awareness), changing attitudes and changing behaviour. The interaction between perceptions, attitudes and behaviours is a complex one.

Perceptions, attitudes and behaviour can change independently of one another. Crucially, a change in perception does not automatically lead to a change in attitude or behaviour – knowing more about an issue does not automatically mean that people feel any different about it. For example, studies on public health campaigns suggest that simply providing information and increasing knowledge about an issue is not enough to achieve (sustainable) attitude or behaviour change.¹ Similarly, behavioural change – in particular a decision to participate in an activity – can come about without any change in perception or attitude. For example, some of the eight million UK residents who wore the Make Poverty History wristband in 2005 may have done so because it became the fashionable thing to do.

If and when there is a link between changes in perceptions, attitudes and behaviour, this change is not necessarily unilinear. Increased awareness may lead to action, but action may also lead to increased awareness – for example, when volunteering in a deprived area makes people realise quite how stark the reality of UK poverty is.

All of this means that it is particularly challenging for UK poverty stakeholders to develop theories of change for their activities. Information-sharing about the prevalence of poverty and about what it means to live in poverty may or may not lead to attitudinal or behaviour change. Encouraging individuals to act on UK poverty may or may not *require* and may or may not *result* in an increase in awareness about UK poverty or a change in attitudes towards UK poverty or people on low income.

All of this also means that it is particularly important for UK poverty stakeholders to be clear about what they are *aiming* to achieve. A lot of UK poverty-related activity is about informing people about the prevalence of UK poverty and what it means to be poor. The assumption that there is a direct line of causality between a better understanding of UK poverty and increased support for anti-poverty (policy) measures is rarely tested or even made explicit by the organisers of information-sharing activities. To be fair to these organisers, building support for action on UK poverty is seldom an explicit objective of their activities. Still, it is surprising that the research came across only one example of an organisation stepping back to question the effectiveness of informing people about the prevalence of poverty in the UK.

Oxfam

Oxfam is currently developing a public awareness-raising component for its UK Poverty programme. The development process is ongoing but preliminary plans are to move beyond questions about whether and how much poverty there is in the UK and focus instead on examples of people living in poverty who are contributing positively to society. This approach would directly try to counteract stereotypical views of people on low income as ‘scroungers’. The rationale for this is that it is unclear what change in attitudes is ultimately achieved by simply convincing people that there is indeed poverty in the UK.

Raising awareness – changing perceptions about UK poverty

Stakeholders reported almost without fail that their audiences react to information about UK poverty by saying that they had not previously realised how stark the reality was. There is a widespread

stakeholder consensus about the fact that large groups of the population are simply not aware about the levels or nature of poverty in the UK – which is also confirmed by research evidence suggesting that less than one in five of the British population recognises relative poverty as poverty.² There were even a number of examples about internal stakeholders (staff or trustees of the organisation involved) being shocked to learn about UK poverty statistics or the reality of poverty in the UK. In some cases, audience reactions went beyond surprise to reflect real outrage. Evidence was mainly anecdotal but it was consistent across case studies. Examples were found across all three categories of support building activities identified in Chapter 2 (informing people, encouraging individuals to act and encouraging organisations to put poverty higher on the agenda).

Anecdotal evidence about audiences registering surprise, shock or outrage

- About 200 phone calls received by Islamic Aid after it had sent out its annual brochure from Muslim families, with many commenting that they were shocked to learn about poverty and social exclusion among UK Muslims.
- A few dozen letters and emails and countless phone calls received by the Migrants Resource Centre following the publication of the *The New Londoners* newspaper, many registering surprise and shock.
- Verbal feedback from participants in poverty-awareness training sessions.
- Reactions from the public at the launch of research reports, including, for example, the *Living with Hardship 24/7* report.
- Several hundred readers writing to the Daily Mirror in the context of its Fair Tipping campaign, commenting that it was the first time that they had actually thought about

how little waiting staff got paid and that it was an outrage that they did not get their tips either.

- Anecdotal evidence of football supporters expressing their outrage during the phone-in following the Fair Pay League radio interview on the national TalkSport radio channel.
- Anecdotal feedback from the Destitution campaign that individuals are shocked to learn about the extent and levels of deprivation among rejected asylum-seekers.
- Anecdotal feedback from businesses participating in the Business Action on Homelessness that the volunteering experiences do raise staff members' awareness of the challenges faced by the people they support.
- Reactions from business leaders following their participation in Seeing is Believing visits (recorded in the feedback report they are asked to write after the visit).
- Anecdotal feedback that local anti-poverty strategies or local challenge documents lead to surprise – people tend to think that they know their local area and are shocked that there are such stark statistics or stories of hardship for their own area. These reactions were noted in London, Dundee, Scottish Borders and Wales.
- Finally, the Commission for Rural Communities commented that journalists and other stakeholders tend to report that they did not realise how much disadvantage there is in rural areas.

As most of this evidence is anecdotal, there is little hard information about the *number* of individuals whose perceptions of UK poverty are being challenged in this way. However, the overall impression is that it seems fairly straightforward to get people to (briefly) realise that their knowledge or perception of UK poverty is limited or flawed.

Feedback forms used during poverty-awareness training allow for slightly more systematic screening of (short-term) impacts. Some people comment that the session confirmed what they already knew; others register their surprise at finding out quite how widespread or challenging living in poverty is. The before and after scores used in external evaluation of the NIAPN poverty-awareness training programme show that most participants score their knowledge and understanding of poverty higher after the training sessions than before. Dare to Care campaign monitoring data shows that one-third of volunteers recognised before their volunteering experience the statistic that 3.8 million children live in poverty in the UK. After the volunteering experience and following training, the figure who knew that the correct answer was between 3.5 and four million had gone up by a third and those who got the answer wrong tended to be closer to the correct answer.³

Changing behaviour – encouraging people to act on UK poverty

There were only a very limited number of examples of individuals being moved to act on UK poverty without explicitly being asked to do something. Following the publication of *The New Londoners* newspaper, the Migrants Resource Centre received a series of telephone calls from people asking how they could provide financial support to asylum-seekers; four individuals called to offer accommodation to one of the asylum-seekers whose story was presented in the newspaper.

Staff from a charity commented that holding a pub talk about some of the people on low income they work with frequently results in a fairly substantial amount of (unprompted) donations. Islamic Aid recalled people asking after they had read its annual brochure what it was going to do about the levels of poverty and social exclusion among Muslims in the UK. Unprompted phone calls or reactions by letter were also recorded in the context of the Fair Pay League and Fair Tipping campaigns.

In most cases, people act on UK poverty as a direct result of UK poverty stakeholders inviting them to take action. Table 1 presents an overview of the number of people engaged in different types of activity on UK poverty (covering selected activities only). The table does not allow for any direct comparison between activities – they differ in their aims and objectives, resources, timescale and target audiences. Still, a limited number of preliminary conclusions can be reached.

- Event-based activities (workshops, training sessions) typically attract fairly limited numbers of participants, from about a dozen to about 150 individuals. The Poverty Alliance theatre play *Heat or Eat* was considered to have been particularly successful (about 100 participants). Early evidence from the 2009 Poverty and Homelessness Action Week similarly suggests that theatre can be a good engagement tool – about 300 individuals watched a performance of the theatre play *Voices from the Edge* in Leeds.

Table 1: Numbers reached by selected support building activities

Organisation/activity	Numbers reached
Workshops or events	
Poverty Alliance poverty-awareness training sessions	On average about 12–15 participants
Poverty Alliance theatre play on fuel poverty	About 100 attending (quoted as fairly high)
Poverty and Homeless Action Week sleeping rough (to raise money) in Chatham	More than 150 people (mentioned as one of the week's highlights)
Poverty-awareness training DVD (Dundee Local Anti-Poverty Strategy)	Used by about ten to twelve local agencies
Borders challenge document launch	About 90–100 participants (in the run-up to Christmas)
London Child Poverty Summit	About 75 participants

Organisation/activity	Numbers reached
Volunteering in deprived communities	
Fit4Finance (Britannia Building Society)	175 volunteers
Dare to Care (CSV and Campaign to End Child Poverty)	39,000 volunteers (target of 35,000)
Business Action on Homeless (Business in the Community)	Over 350 companies
Petitions	
Living Wage petition (Downing Street e-petition)	1,272 signatories
Campaign to End Child Poverty	2,500 banners/participants in the online rally
Give Me Five campaign (FOCUS)	3,500 signatures
One Million Children campaign (Shelter)	6,000 photographs of supporters in the 'Red Chair' (overall 100,000 registered as supporters of the campaign)
Writing to MP	
Make Child Benefit Count (Child Poverty Action Group)	4,000 emails/letters
Destitution campaign (Refugee Action)	400 emails/letters
Wearing sign of support/applying for campaign materials	
Anti-Water Tax campaign (Northern Ireland Anti-Poverty Network)	10,000 car stickers distributed
Winter Deaths campaign (Help the Aged)	75,000 action cards and 120,000 free thermometers distributed
Participation in a rally	
Keep the Promise Trafalgar Square rally (Campaign to End Child Poverty)	10,000 participants
Newsletters	
Monthly CRC newsletter	A few hundred subscribers
Facebook sites	
Fair Pay League Facebook site	134 fans (to date)*
London Living Wage Facebook site	204 fans (to date)
Dare to Care Facebook site	440 fans
End Child Poverty Facebook site	3,090 members
Oxfam's recent End UK Poverty and Inequality Now Facebook site	1,309 members (to date)
Other online resources	
London Child Poverty Pledge YouTube video	About 7,500 viewings (to date – most popular video on the DCSF YouTube channel)
CRC Financial Inclusion YouTube video	About 70 viewings (launched about six months ago)
Child Poverty Solutions Wales website	1,516 unique visitors between its launch in September and December 2008
Get Fair campaign website	2,677 unique visitors between its launch in May 2008 and January 2009
CRC RSS feeds	About 6,000 subscribers
Other	
Scottish Government Tackling Poverty Framework consultation	138 responses (the total number of responses is low compared to, for example, the Scottish Government consultation about the introduction of anti-smoking legislation, which attracted more than 50,000 responses. The vast majority of responses (106) to the poverty consultation came from organisations rather than individuals)
Campaign to End Child Poverty	More than 150 member organisations
London Child Poverty Pledge	About 20–30 organisations signed up (to date)

* 'To date' refers to January 2009 data.

Source: stakeholder interviews, evaluation reports and campaign websites.

- Activities aimed at putting UK poverty higher on the agenda of organisations appear to attract more modest numbers, similarly up to about 150 (organisations rather than individuals). However, through online resources, these activities can reach several thousand individuals.
- Requests to activists to demonstrate support for a particular policy measure can typically hope to reach a few thousand activists, although the range varies between a few hundred (Destitution campaign) and a hundred thousand (Shelter's One Million Children).

Who is being encouraged to act, is often unclear. In particular in the context of campaigns, the objective is often to *demonstrate* rather than build public support – *who* is reached is less important than the *numbers* that are reached and can be presented to politicians. That being said, several advocacy campaigns succeeded in reaching beyond the 'usual suspects' – if mainly in the sense that they engaged individuals who had not previously been involved in volunteering or activism (rather than individuals who were initially less likely to support anti-poverty measures).

Direct evidence of organisations reaching out to individuals who had not previously been involved in campaigning or volunteering in deprived communities

- The in-house evaluation of the Dare to Care campaign shows that almost three-quarters of volunteering activities organised by local groups were part of an ongoing programme (as opposed to being organised just for Dare to Care). Interestingly, two-thirds of volunteers indicated that they had not previously been involved in volunteering (Dare to Care could also present data on the age and qualification levels of volunteers, showing a bias towards younger volunteers).
- A number of individuals participating in the Keep the Promise rally in October 2008 were captured on video saying that they had never previously participated in a rally or demonstration. The video also showed

that some participants had travelled from Wales and Scotland.

- Refugee Action had never previously asked its donors and supporters to get involved in advocacy. Although signatories to the Destitution campaign petition might have been involved in other campaigns, it was the first time that they had signed a Refugee Action petition.
- The in-house evaluation of the One Million Children campaign shows that more than half of campaign supporters were recruited outside Shelter's existing donor base.

Activities aimed at encouraging *organisations* to put poverty higher on the agenda often explicitly aim to reach those organisations not yet convinced about the reality of UK poverty or its relevance to their organisation. Documents and interviewees tend to point to the *breadth* of engagement as implicit evidence of their reach – rather than to detailed and systematic background knowledge about the starting positions of the organisations they had reached.

Evidence of the breadth of engagement

- For example, signatories to the Child Poverty Pledge include Conservative-led, Labour-led and Liberal Democrat-led councils, the Jobcentre Plus office and local health boards.
- The 140 organisations signed up to the Campaign to End Child Poverty include not only the traditional children's charities but also organisations that had not previously worked directly on child poverty (such as trade unions).
- No less than 29 out of 32 Scottish local authorities joined the Local Authorities Tackling Poverty Network, which was set up to provide an input to the Scottish Government Tackling Poverty consultation.

- The Capital Gains launch conference attracted delegates from a wide range of organisations and agencies including MPs, central, regional and local government, housing organisations and a range of voluntary, community and charity organisations.
- The London Child Poverty Commission also succeeded in engaging with (private sector) employers.
- Since 1990, more than 6,000 business leaders have participated in more than 450 Seeing is Believing visits.

Unsurprisingly given the challenges involved in tracking individuals' involvement over time, there was only limited information about the extent to which UK poverty stakeholders sustained engagement. That being said, there was some anecdotal evidence that a campaign could trigger existing supporters or participants into becoming real *champions* for the cause.

Evidence of more in-depth or sustained engagement on UK poverty

- In the context of the Give Me Five campaign, the initial signatories to the petition tended to be individuals who were directly affected by the low permitted earnings threshold. A number of these first supporters became very active campaigners who recruited people to sign the petition in local communities – some of these new activists succeeded in collecting more than 150 signatures.
- A chief executive of a major corporation participated in a visit to a hostel where he had a chance for the first time to talk to some homeless people. The experience made him commit to becoming more active and he is now an active member and chair for Business Action on Homelessness.

- Business in the Community survey evidence on Seeing is Believing participation indicates that about 70 per cent of those taking part report that they changed the way they do business as a result of their Seeing is Believing visit and 80 per cent became personally more active in the local community.
- Dare to Care evidence showed that more than 90 per cent of volunteers reported that they were planning to continue to volunteer in future – this figure needs to be seen against the finding that two-thirds of volunteers were new to volunteering.

More generally, the overall impression is that many of the initiatives aimed at putting poverty higher on the agenda of organisations have a fairly strong *mobilising* effect and succeed in creating a certain 'momentum' around UK poverty among organisations and staff (as distinct from the wider public). The impression is that there is currently a certain 'buzz' around child poverty across the UK and around poverty in Scotland – possibly linked to the existence of hard government targets in the child poverty area that are missing elsewhere.

For example, the Campaign to End Child Poverty, the London Child Poverty Commission, the Child Poverty Unit and the Child Poverty Solutions Wales toolkit all appear to be both manifestations of the UK-wide child poverty 'buzz' and contributing to this trend. Other manifestations include the fact that local authorities across Wales and England are working around child poverty targets and, in Wales, Communities First and Children and Young People partnerships have included a child poverty dimension. Conservatives and Liberal Democrats are echoing the Government's commitment to end child poverty by 2020. For most initiatives, there was some (anecdotal or indirect) evidence that they had indeed contributed to increased interest in the child poverty agenda.

Case studies: evidence of contributions made by child poverty initiatives to placing child poverty higher on the agenda of organisations/politicians

- Interviewees frequently referenced each other's initiatives as factors that had contributed to making their own child poverty activity more effective. For example, the work of the London Child Poverty Commission was felt to have prepared the work of the London Child Poverty Pledge.
- The popularity of the Child Poverty Solutions Wales toolkit – and, importantly, a number of (unprompted) requests for training and support in using the toolkit. Project staff generally feel that it had been relatively easy to engage local authorities with the toolkit – contrasting local authority interest in child poverty now with limited take-up by local authorities of the Quids for Kids scheme a few years ago.
- The number of website hits for the Child Poverty Pledge YouTube video (almost 6,000 in the first month and a half).
- Willingness of politicians to engage with initiatives, showing they take them seriously – for example, the Prime Minister agreeing to receive an End Child Poverty delegation, the Mayor of London attending a London Child Poverty Commission conference, the Minister for Welfare Reform launching the London Child Poverty Pledge.
- Similarly, policy documents referencing these initiatives (for example, the London Child Policy Commission being mentioned in HM Treasury Budget documents; End Child Poverty being credited by politicians in the press and in the House of Commons as having contributed to placing poverty higher on the political agenda).

- Partner organisations being willing to reference and promote initiatives (such as the End Child Poverty or the London Child Poverty Pledge) on their websites.
- The 'buzz' created by the End Child Poverty Trafalgar Square rally among End Child Poverty member organisations as evidenced by several (unprompted) congratulatory emails to the End Child Poverty staff team. Members talk about never having seen anything like the rally '*in all the 26 years*' they have worked in childcare issues and the rally having given '*a real boost*' to staff and everyone involved.

There is some evidence that these initiatives have succeeded, not just in making more 'noise' about poverty at organisational and political level, but also in getting national, regional and local governments and partners to put poverty higher on the list of priorities in more practical ways.

Case studies: examples of more practical manifestations of organisational support for the poverty agenda

- The Dundee Local Anti-Poverty Strategy has succeeded in getting certain elements of the initial anti-poverty strategy mainstreamed in policy and practice.
- There are examples of Welsh local authorities putting child poverty on the scrutiny committee following the publication of the Child Poverty Solutions Wales scrutiny guide.
- The Borders challenge document contributed to creating an environment where funds could be ringfenced to fight poverty despite budget constraints.
- Gateshead Housing Company's Anti-Poverty Strategy has succeeded in increasing awareness of staff and changing

the way they work with tenants. Since the introduction of new procedures advising tenants on benefits and finance, the number of arrears have fallen by half within the group of new tenants because of extra preventative work with those most at risk.

- A number of the Capital Gains report recommendations have been taken on board by the Government – for example, a London dimension has been introduced to the DWP/DCSF Child Poverty Unit.
- The London Child Poverty Pledge asked organisations, not only to pledge their support for the child poverty agenda, but also to develop action plans demonstrating how their organisation would do more to contribute to the eradication of child poverty in the capital. Organisations were asked to take at least one action that was additional to what they were already doing. All signatories to date have developed action plans.

Changing attitudes

Although one should be careful with arguments from silence, there was significantly more (anecdotal) evidence about individuals changing their perceptions (registering their surprise) or changing their behaviour (participating in a UK poverty-related activity) than about changes in attitudes. Changing attitudes is particularly complex – people’s attitudes towards UK poverty may not be particularly strong or well defined and may not even be internally consistent.

Changing attitudes towards policy measures

The research came across very little if any anecdotal evidence suggesting that people have become more supportive of anti-poverty measures simply as a result of being told how much poverty there is in the UK or what it is like to live in poverty. There was some anecdotal feedback about *decision-makers* changing their position on a particular policy measure when learning more about UK poverty. More frequently, feedback about politicians referred to a change in

perceptions (surprise) and a more general renewed or strengthened resolve to improve the situation of disadvantaged communities.

Examples of decision-makers changing their position on a policy measure in favour of people on low income

- A senior church official became more supportive of the efforts of a church grass-roots worker supporting people in poverty as a result of a testimony by a person on low income. The church official had previously believed that efforts and (staff) resources should be focused on church attendance/survival.
- One interviewee recalled how, during the early days of the Debt on our Doorstep campaign, the testimonies from a number of people on low income to the relevant parliamentary committee had powerfully affected some Labour backbenchers. The backbenchers were no longer prepared to follow their Government on a proposed bill (warranting sales in a situation of debt).

There was only one example of a member from the wider public changing his attitude towards a particular policy measure. A local authority managing a benefit-entitlement awareness-raising campaign recalled an angry call from a former colonel who did not want his tax money to be spent on benefit take-up campaigns. His position changed dramatically after he was told that a former serviceman had been helped through the campaign; he ended the phone call by commending the council for its action and encouraging a continuation of the campaign.

Hard evidence on a change in ‘attitude’ came from the Dare to Care survey of volunteers. The number of volunteers who strongly agreed that it is important for the UK to end child poverty had increased by 3 per cent and there was also a 10 per cent increase in volunteers who believed that individuals could contribute to ending child poverty.

A change of attitudes towards people on low income

There is relatively limited evidence to what extent information-sharing alone about the prevalence of poverty and about what it means to live in poverty can change people's attitudes towards people living in poverty and in particular benefit claimants (perceived by some as 'scroungers'). Poverty-awareness training sessions in particular are considered to be effective in allowing these negative or stereotypical attitudes to surface, which is seen as a necessary first step in tackling stereotype. However, poverty-awareness training organisers warn that allowing prejudices to surface does not automatically mean that more positive views of people living in poverty will prevail. People's reactions can go in either direction. For example, people living in poverty themselves can react quite negatively to hardship stories, commenting that they are or were in a similar position and quite able to cope without additional support. During poverty-awareness training sessions targeting social workers, there is often a minority view that the stories present a distorted picture and that parents on low income should not be allowed to use poverty as an excuse for bad parenting. This is seen as discrediting the many people in poverty who are doing a good job at parenting. The Spotlight documentary *Life Swap* might have triggered significant public debate in Northern Ireland, but some phone-in reactions to the BBC Northern Ireland's *Nolan* show were quite negative.

5 What works?

Capturing the audience

The first challenge appears to be ‘capturing’ the audience. Once people are listening or reading, there is a fair chance that they will improve their understanding of UK poverty – given that initial levels of understanding of what UK poverty means are low. Using the term ‘poverty’ appears unlikely to work at this stage, except when targeting partners in the UK poverty sector or, to some extent, public sector stakeholders. For example, King’s College London secured significantly less interest for a conference with ‘poverty’ in the title targeting social workers than for a conference addressing the issue of neglect. The case studies suggest three broadly effective approaches of catching an audience.

- Working by stealth – ‘hiding’ the information in a format that at first sight has nothing to do with informing people about UK poverty. Examples include the light tone and tabloid style of *The New Londoners* newsletter, reality TV programmes such as the *Life Swap: Diamonds and Dole* documentary, the Islamic Aid newsletter, which is predominantly about *international* poverty, or even attracting people to a poverty-related event through the presence of politicians or celebrities.
- Working through a champion – identifying someone in an organisation or community who is passionate about doing something on UK poverty and getting this individual to help organise a poverty-related event and encourage others to attend the event. This is, for example, true for the Poverty and Homelessness Action Week activities, which depend on local grass-roots volunteers to take an initiative, and for many of the poverty-awareness training sessions, where one individual can be instrumental in getting colleagues, friends or neighbours interested.

- Focusing on a more specific sub-theme of UK poverty, such as homelessness, low wages or debt.

Paradoxically, activities open to the *wider public* may risk attracting mainly individuals who are already interested in the poverty agenda; events targeting *specific sub-groups* (such as the King’s College London poverty-awareness training targeting social workers, the Poverty Alliance poverty-awareness training targeting Culture and Sport Glasgow staff, the Fit4Finance volunteering scheme targeting employees in Britannia Building Society, *The New Londoners* newsletter targeting London commuters, the Fair Pay League campaign targeting football fans) are arguably more random in their audience selection and thus more likely to capture a cross-section of the population in terms of awareness of and attitudes towards poverty. This is reflected in staff feedback about participants in the Poverty Alliance and King’s College London poverty-awareness training sessions. Participants were reported as (sometimes) having fairly negative or stereotypical views about the causes of poverty or people living in poverty.

A number of case studies are particularly interesting because their targeting strategies are both highly specific and quite wide. For example, Islamic Aid sends its brochure not only to its donors and supporters, but also to 500,000 UK Muslim households. *The New Londoners* newspaper aims specifically to catch the attention of commuters looking for a light read on their train journey home, not only people already interested in poverty or in asylum issues. The Fair Pay League campaign specifically targets football fans, but tries to reach out to large audiences through media work.

The most successful campaigns in terms of reach had a clear targeting strategy and used a mix of channels to reach their target audience(s). Successful outreach methods were mainly proactive

outreach methods – where the campaign is taken to supporters rather than waiting for supporters to discover the campaign.

Case studies: importance of targeting and proactive outreach

- Outreach activity for the One Million Children campaign included a substantial campaign presence on the Shelter website, which attracted over 119,000 visits; a Google ad words grant promoted the site; and innovative online campaigning tactics such as the Big Brother viral, the Shelter sit-in online photo gallery and the big Shelter Housing Poll built supporter involvement. The 'Red Chair' photograph 'petition' was taken to 25 towns and cities across the UK and campaign adverts were set up in the Westminster tube station. Finally, significant media work (generating more than 600 million opportunities to view) increased the visibility of the campaign. The success of the campaign is evidenced by the 100,000 supporters who were recruited to the campaign and the fact that more than half of the supporters were recruited outside the existing Shelter donor base.
- The Winter Deaths awareness-raising campaign likewise used a number of mechanisms to proactively reach out to audiences. GMTV daytime programming was used and 'props' were offered to individuals who engaged with the campaign. About 50,000 greeting cards were distributed – individuals were encouraged to apply for a greeting card, which they could send to an older person they knew; the greeting card included a voucher for a free benefit check. Moreover, a total number of 120,000 free thermometers were given away by the campaign. People phoned the dedicated phone line during the GMTV show to request the thermometer and a card. In addition to the TV campaign, the organisers ran an advertisement pilot featuring June Whitfield in 32 Life Channel broadcasts in GP surgeries, post offices and similar public places. Evidence of the success of this approach to outreach is not just the number of cards and thermometers distributed, but also the results of DWP analysis, which compared different engagement methods and concluded that the card scheme scored quite well.
- The Dare to Care campaign used a range of mechanisms to promote volunteering, including distribution of 600,000 campaign postcards at cinemas and universities, London bus and tube ads, a sustained media relations campaign and a range of email, web (including a Facebook site) and telemarketing methods. Key audiences (including youth clubs, children's centres and voluntary and public sector organisations) received direct mail and email invitations to workshops introducing the campaign. A second direct mailshot was sent out to approximately 10,000 organisations. To engage with younger volunteers, lesson plans were written to support learning in Key Stages 3 and 4 around the key themes of the campaign. This mix of outreach mechanisms helped the campaign secure almost 40,000 child poverty volunteers.
- The Living Wage online petition, unlike many of the Downing Street e-petitions, did not just wait for potential signatories to find the petition; the organiser set up a separate dedicated Living Wage website, obtained support for his petition (and web links) from key UK poverty stakeholders – including, for example, the Northern Ireland Anti-Poverty Network – and, crucially, sent out several thousand emails to individuals whom he felt might be supportive of the living wage concept. The contact details for these several thousand individuals were obtained through simple Google searches. There are currently 95 closed Downing Street e-petitions that refer to 'wage' in the

title; about two-thirds of these secured less than 25 signatories and only about one in ten reached the 200 signatures threshold required to get a written government response. The online Living Wage petition is one of only two petitions (with 'wage' in the title) that succeeded in reaching more than 1,000 signatures.

Messaging

Unpacking the term 'poverty'

Initiatives that do use the term 'poverty' agree that it is important to take time to 'unpack' what is meant by the term. People need practical examples of the kind of choices those on low incomes have to make. Different tools to challenge people in considering how they would cope on a low income appear to be widely used and are thought to be effective. Audiences almost inevitably conclude that the budgets available to people on low income (minimum wage, benefit levels) are not sufficient. Examples include the street survey by *The New Londoners* newspaper asking people on the street how they would cope on the £5 per day vouchers that rejected asylum-seekers receive from the Government, budgeting exercises used in poverty-awareness training sessions and recent JRF research where focus group participants were asked to calculate minimum income standards for different household structures.¹ Stories about how poverty affects children's ability to fully participate (for example, go on a school trip) and parents' feelings of guilt about this were also quoted as effective. Stakeholders targeting public sector colleagues or partner organisations similarly felt that making the poverty agenda relevant, taking organisations' own remit and priorities as a starting point was key to engagement. For example, some trade unionists were initially not keen on getting involved in the child poverty agenda, but could be brought on board by linking it to the gender discrimination agenda.

Specific messaging, focusing on absurd situations of systemic injustice that can be resolved – not undermining the public's interest

The overall impression is that audience reactions are more likely to go beyond *surprise* and register real *outrage* when the messaging is more specific and focuses on absurd or extreme situations of systemic injustice with an achievable solution – something that can be 'resolved'. For example, reactions of outrage were noted in the context of *The New Londoners* newspaper (with its messaging of a government-sponsored voucher scheme expecting rejected asylum-seekers to cover all their costs with £5 per day, seen as absurd by the people who reacted) and the Islamic Aid newsletter (referring to the systemic injustice of higher levels of poverty and social exclusion among UK Muslims). Reactions of outrage were also noted in the context of the Fair Pay League campaign (which contrasts the low wages of cleaners with the astronomical wages paid to star footballers). Interestingly, these were also the case studies most likely to present evidence of (unprompted) activity on UK poverty. Previous PIPI research² similarly suggests that messages that include clear and simple ideas for policy interventions are seen as more worthy of attention – focus group reactions suggest that, without clarity about solutions, the problem seems incoherent, intractable and hopeless, and individuals worry that their well-meaning support might be used for ends they disagree with.

In addition, sub-themes linked to social inequality and to those people for whom the public is perceived to have more sympathy (such as working people on low incomes) resonate significantly better with the wider public, especially when the messaging positions those people on low income against a 'villain'.

Case studies: specific messaging about an obvious injustice linked to a clear solution and casting working people on low incomes or others for whom the public is perceived as having more sympathy against a ‘villain’

- The wide appeal of the Living Wage campaign is testimony to the effectiveness of its highly specific messaging, its focus on working people on low incomes, the simplicity of its argument and the absurdity of the injustice – the wage differentials between bankers or footballers and cleaning staff working for financial institutions or Premiership football clubs. Evidence to support the wide appeal of the living wage includes the fact that more than 120 US cities and states have passed living wage legislation since 1994; within the UK, living wage campaigns are being managed in London, Cambridge, Oxford, Norwich, Glasgow, Scotland-wide and elsewhere. Similarly, none of the recipients of an email message about the Living Wage Downing Street e-petition reacted negatively about the living wage concept – there were some negative reactions, but they related only to concerns about how the petition organiser had got hold of their email address.
- Another example is the *Daily Mirror’s* Fair Tipping campaign, which highlighted the loophole in the law that allows companies to pay restaurant staff less than the minimum wage and then make up the difference with tips – resulting in reactions from several hundred readers. The campaign messaging again relates to something that is highly specific, has a clear solution and casts the hard-working waitress against an ‘evil’ manager.
- The Northern Ireland Anti-Water Tax campaign was similarly very specific about

an obvious injustice, presented as absurd. Northern Irish people would be asked to pay twice for their water, given that their household rates (which are equivalent to the English council tax) already cover water and sewerage services. Moreover, people on a low income would suffer disproportionately from the introduction of a water tax. Trade unionists raised concerns about the privatisation of water services, effectively casting private water companies in the role of ‘villains’ to some extent.

- The Destitution campaign is an interesting example. The campaign covers a specific issue (destitution among rejected asylum-seekers) and offers a clear solution (the Australian approach of offering counselling support to rejected asylum-seekers) and presents the destitution as a clear and systemic injustice. The destitution is caused through a government-managed scheme that expects human beings to survive on £5 per day. Still, asylum-seekers are not necessarily perceived by the wider public as deserving sympathy. This may help explain why the campaign, which has been successful in engaging its donor base (previously not engaged in campaigning) in advocacy and has already achieved some results in its dialogue with policy-makers, has not generated the levels of mass public support seen in similar campaigns. The more modest campaign budget and the clear campaign focus on policy advocacy (mass public outreach is not a campaign objective) may also be relevant in this respect.

Approaches that highlight the benefits of the campaign proposals to the audience or at least do not undermine the audience’s own interest tend to be more effective. Improving life for people on low income is rarely highlighted as the (only) reason to get involved.

Evidence supporting the importance of not undermining the public's own interest

- In the context of volunteering, arguments of career development or enriching one's own life tend to be used as well.
- The Anti-Water Tax campaign proposals allow *everyone* to gain (by not having to pay water charges), not just the people living on low income.
- Initiatives such as the Living Wage, Fair Tipping and Loan Shark campaigns allow the audience to be outraged at an injustice without fear that they will have to give up any personal privileges; rather, it is banks, football clubs, restaurant managers or doorstep lenders who will need to give up some of their profits.
- Interestingly, anecdotal feedback from the Fair Pay League campaign suggests that people readily agree with the principle of the living wage; football supporters' only concern is that the living wage might increase their ticket price. This suggests, indeed, that campaign engagement becomes much more difficult only when personal interests are under threat.
- This is similarly supported by recent research findings³ that a large and enduring majority of the public feel that the income gap is too large, but support for redistribution does not match this. The research explains that theories based on the role of self-interest have long been championed by economists. The argument, taking redistribution as an example, is that people will support or oppose action depending on the extent to which they personally benefit or lose out financially. Individuals may feel that the income gap is too large, believing that they do not receive their fair share compared to higher income earners, but may fear that redistribution could leave them worse off.

- Similarly, extensive research by the Ford Foundation (2001)⁴ on public perceptions in the United States about working people on low incomes suggested that campaigns should speak in terms of ways to plan the economy so that it works for all Americans.
- Conversely, individuals who have a clear stake and will directly benefit from campaign proposals are more likely to 'act' and get involved. For example, the earliest and most active Give Me Five campaigners were those who were directly affected by the £20 permitted earnings threshold.

Keeping things light

Finally, innovative, light-touch approaches, ideally peppered with some humour, appear most effective in capturing popular interest (and media coverage). Although stakeholders agreed that there was a huge need for information-sharing given low levels of awareness about UK poverty, many stressed the need to keep the message light and positive, and to avoid 'preaching'. Making the audience feel guilty or personally responsible was thought to be counterproductive. This is not to say that creating a sense of injustice cannot be effective – the point is not to cast the audience or readers in the role of 'villain'.

Evidence supporting the importance of light-touch approaches and humour

- The annual Peanuts for Benefits campaign found that it achieved most of its media coverage when someone dressed up as a gorilla literally delivered a wheelbarrow of peanuts to benefit agencies.
- The Anti-Water Tax campaign used the TV programme *Little Britain's* 'The computer says no' T-shirts during one of its demonstrations.
- The Keep the Promise rally organisers tried to generate a carnivalesque atmosphere – and succeeded in their attempts, as explicitly evidenced in the

unsolicited complimentary feedback emails from member organisations and rally participants. More generally, End Child Poverty (and others) have focused on developing a positive brand identity – for example, through the Keep the Promise logo, making audiences associate the campaign with positive messaging.

- The 2008 Refugee Week was launched through the Celebrating Sanctuary music festival on the London South Bank – focusing on positive messaging (*celebrating* sanctuary) and aiming to also attract people looking for a fun day out on a sunny Sunday.
- The One Million Children’s ‘Red Chair’ photograph petition is another example of a fun, innovative approach, as is Save the Children’s ‘Door on Tour’, which literally saw a door (representing 10 Downing Street) travelling the country to engage the public and local politicians in the child poverty agenda.
- The NIAPN poverty trap game was mentioned as a fun and effective method of getting messages across, based on focus group responses during the external evaluation of the NIAPN poverty-awareness training.
- Similarly, the Poverty Alliance multiple-choice quiz was introduced following anecdotal feedback from participants and from an external evaluator observing the training sessions that just presenting the ‘dry’ statistics risked turning people off from the start.
- *The New Londoners* newspaper makes a number of points about the stark reality of destitution among asylum-seekers through a tabloid-style paper with a positive tone – in this case even avoiding the use of poverty or destitution terminology altogether.

Perhaps surprisingly, given this point about keeping the message light and positive, most information-sharing about UK poverty focuses on presenting (only) the hardship and stark reality of living in poverty. Success stories are perhaps more common in the context of *campaigns* than in other public support building activities (such as poverty-awareness training). Campaigns sometimes use case studies to show how a change in approach would indeed lead to a better life for the target group. For example, living wage campaigns compare and contrast employees who do and do not receive the living wage. Even in campaigns, however, the focus often remains on portraying the hardship of living in poverty.

Risk of focusing on obvious injustices and not undermining the audiences’ interest

It is unclear whether messaging focusing on obvious injustices and not undermining the public’s own interest can generate support for the UK poverty agenda at a more general level – in particular, support for more unpopular policy measures aimed at helping people on low income towards whom the public may be less likely to have a positive attitude (unemployed or inactive people). This type of messaging tends not to challenge, in any way, public attitudes towards some people on low income as ‘scroungers’.

Interestingly, there are only a limited number of campaigns focusing on direct increases in the amounts of money (wages or benefits) received by people on low incomes and these tend to focus on the people living in poverty who are more likely to receive sympathy from the wider public – in particular, children, older people or working people on low incomes. Examples are the Make Child Benefit count (championing an increase in child benefit) and the different campaigns linked to wage levels (the Living Wage petition, the Fair Pay Network, the Fair Tipping campaign). Although there are charities that are campaigning for a better benefit regime for other groups (such as lone parents), the research did not identify benefit-linked campaigns for these other groups based on *popular* mobilisation. The Give Me Five campaign, which focuses on incapacity benefit claimants is an exception, but even there the campaign ask does not relate to an increase in the benefit level, but to an increase in the threshold of permitted

work pay. Indirectly, then, the focus is again on individuals for whom the public is perceived to have more sympathy – incapacity benefit claimants *who work*. The only real exception is the Peanuts for Benefits campaign, which aims to raise awareness of jobseekers' benefit levels and build public support for an increase in benefits. However, the campaign cannot be considered to have been a complete success. Although it generated media coverage, the coverage was by no means entirely supportive.

Messaging vs. dialogue

Research on communicating asylum to the public⁵ suggests that bringing people into a dialogue on controversial issues is likely to be more effective than simply sending out messages towards a 'passive' audience. There is only limited evidence from the UK poverty sector on this issue. UK poverty sector stakeholders often shy away from controversial issues and much activity is messaging rather than dialogue. Clear exceptions are poverty-awareness training and volunteering in deprived communities, which offer direct opportunities for interaction and discussion; Business in the Community's Seeing is Believing visits similarly provide a platform for dialogue.

Poverty-awareness training indeed appears to be powerful in unearthing stereotypical attitudes, but participants' reactions can go in either direction. On volunteering, there is fairly strong evidence that the direct interaction between the volunteer and the individuals living in poverty can have a significant and lasting impact on perceptions, attitudes and behaviour of the volunteer. For example, Dare to Care evidence showed that more than 90 per cent of volunteers were planning to continue to volunteer and there was a 10 per cent increase in volunteers who believed that individuals could contribute to ending child poverty. Business in the Community survey evidence on Seeing is Believing participants indicates that about 70 per cent of those taking part report that they changed the way they do business as a result of their Seeing is Believing visit and 80 per cent became personally more active in the local community. It may well be that it is the *informal* but in-depth dialogue with people living in poverty rather than the more *structured* interaction in the context of poverty-awareness training that 'works' best.

Channels and mechanisms for getting the message across

Statistical information vs. stories

Reactions of surprise were recorded both when audiences were presented with statistical information about the prevalence of poverty and when organisations provided them with real-life 'stories' about UK poverty. For example, the annual Islamic Aid brochure uses only statistics and succeeded in generating quite strong responses from recipients. However, by and large, the available evidence suggests that stories are more effective – in particular with the wider public. This confirms earlier research findings from focus group discussions showing that stories are effective in making poverty tangible and immediate, and getting people to talk about poverty-related issues in a more animated, personalised and empathetic way.⁶ At one level, one may even argue that Islamic Aid's success through use of statistics is exceptional and may be explained by the story *behind* the statistics. The reactions of recipients of the brochure did not focus on specific statistics but on the fact that UK Muslims scored worse than the population at large.

Evidence suggesting that statistics turn audiences off

- Poverty Alliance used to start its poverty-awareness training sessions with a series of statistics about UK poverty, but feels its new approach, presenting poverty statistics through a multiple-choice quiz, works better in engaging with the audience.
- Research found that a majority of focus group participants were surprised to learn that 3.4 million people in the UK were living in poverty. They were generally unmoved by this.⁷
- Research by Ipsos MORI showed that focus groups expressed initial surprise and shock when statistics about UK poverty were shown, but this surprise gave way to scepticism and groups found it easy to 'brush off' statistics and argued about the validity and provenance of the facts.⁸

- A voluntary sector organisation found that there was no difference in the proportion of the British public aware of one of its key campaign messages (a key UK poverty statistic) despite a well resourced campaign.

That being said, statistics can play an important part when aiming to influence public sector stakeholders and are valued by the media and decision-makers.

The impact of the stories appears to be related to how close the link is between the audience and the person living in poverty. Face-to-face contact in particular was thought to be quite powerful. When organisations were asked why they felt stories were effective, many of the examples they quoted were instances of face-to-face contact. One interviewee recalled a politician reporting after a policy hearing that ‘*you hear things differently when you see people in the eye*’. Other examples quoted were: the impact of *The Big Issue* street vendors directly sharing their stories with customers; the impact of direct contact between volunteers and people on low income in volunteering schemes; and the power of a direct dialogue between politicians and officials and people living in poverty in the Borders Getting By, Getting Heard poverty hearing event. Volunteering is arguably the most direct way to experience the power of a real-life case study and provides an opportunity for volunteers to realise that poverty is not just about money but also about the experience of living in poverty.

Similarly, video material showing people living in poverty telling their stories and stories told by voluntary sector staff about their first-hand experience of trying to help people on low income were quoted as examples. NIAPN reported that the video material they developed on the basis of the BBC Spotlight documentary *Life Swap: Diamond and Dole* was effective in getting a discussion going during their poverty-awareness training sessions. The *Wrong Trainers* animation video, documenting the real-life stories of six children living in poverty, is being used by several stakeholders in the poverty sector and is widely thought to be powerful and effective.

Written case studies were mentioned less frequently but there was still evidence of written

case study material having an impact. In particular, *The New Londoners* article written by novelist and poet Mark Haddon and recounting the experiences of a number of asylum-seekers was quoted most often in readers’ anecdotal feedback to the Migrants Resource Centre. Similarly, the research report *Living with Hardship 24/7*, which featured the real-life stories, experiences and views of people living in poverty, led to reactions from readers that they had not previously realised quite how challenging parenting and living in poverty was.

Credibility and role of the messenger

More generally, the credibility of the messenger was felt to be crucial. Information can lead to a change in perceptions only if audiences believe the messenger. Different stakeholders interpreted this in different ways. For some, stories were felt to be effective precisely because people living in poverty themselves can act as credible spokespeople because of their first-hand experience of UK poverty. Others, such as Islamic Aid, referred to the value of using official government data – this meant that other *organisations* (as opposed to individual members of the wider public) could feel confident that they were reliable and start using them. Similarly, the fact that Islamic Aid is a *Muslim* organisation reaching out to the *Muslim* community was felt to be important – messages from other, non-Muslim stakeholders about problems in the Muslim community are often perceived as negative or stereotypical portrayal of Muslims. This is further supported by the fact that a limited number of recipients of the Islamic Aid brochure contacted the charity to complain that they had fallen in the trap of believing and spreading government disinformation about the Muslim community.

Others felt that funders and research institutes had a particular role to play in sharing information about UK poverty because they were seen as more independent and objective than other stakeholders. More generally, research-based campaigning was a feature of most of the case studies explored. This could include research into the prevalence or nature of poverty among a particular target group or in a particular area, public opinion surveys showing how strongly the public feels about a particular issue or evidence that a particular malpractice is indeed taking place.

Case studies: importance of research-based campaigning

- The Fair Pay League undertook research about wage levels in premier league football clubs by screening and applying for vacancies. The campaign then approached the *Mirror*, which decided to cover and support it. The *Mirror* suggested that it was the initial piece of research showing the vast wage differential between football players and those working for football clubs (such as cleaners) that made it run the story.
- The Winter Deaths campaign commissioned research by the London School of Economics, which was publicised on the Channel 4 lunchtime news and led Channel 4 to ask the Government for a reaction on automatic payment of benefits to pensioners.
- Business Action on Homelessness was triggered by Bain and Company research comparing and contrasting customers' and businesses' perceptions of the relative importance of homelessness as a priority issue for charitable action by business.
- The trade unionists involved in the Anti-Water Tax campaign in Northern Ireland used international research evidence about the impact of privatisation of water services.
- End Child Poverty commissioned research to develop ward- and constituency-level data on the prevalence of child poverty.
- The Destitution campaign was launched following clear research evidence in the 2006 Refugee Action report *The Destitution Trap* about the level and extent of destitution among rejected asylum-seekers.
- At the level of local authorities in particular, research evidencing the prevalence and nature of poverty locally was felt to be useful. For example, in Dundee, research on poverty in the area was seen as having greatly facilitated the development of the local anti-poverty strategy.

Different mechanisms to sign up supporters

It appears that the most successful engagement methods (in terms of numbers reached) are those that require the least efforts from campaign activists. The research looked at only a limited number of campaigns, so drawing firm conclusions is difficult. Still, getting supporters to sign a petition appears to be easier than getting them to write to their MP. Getting supporters to write to their MP appears to work better if there is a ready online form for them to do so. Getting supporters to sign a petition works better when they receive an email or when the petition 'comes to them' (as in the One Million Children 'Red Chair' tour of the country or the community outreach by Give Me Five campaign activists) than when they have to go and find the petition website. For example, the Living Wage online petition found that the vast majority of signatories were people who reacted to the electronic mailshots and that a smaller number of people signed up through the dedicated Living Wage website. Similarly, Give Me Five found that only about 1,000 of the 3,500 signatories to its petition were achieved through the Give Me Five website.

Media work

Media coverage of UK poverty has the potential to reach large numbers of people and a wide cross-section of the population, including individuals with very different starting positions in terms of their perceptions and attitudes towards UK poverty. This can include media coverage generated following a push for coverage from third-sector organisations that try to encourage coverage of their own campaigns or messages, as well as coverage generated by the media itself without an external push factor. The scope for reaching large numbers of people is exemplified by Channel 4's *The Secret Millionaire* – the series attracted no less than four million viewers per episode during the 2008 series. Unsurprisingly, then, many UK poverty stakeholders actively try to generate media coverage for their messages. Several campaigns have been successful in generating several million or even several hundreds of million 'opportunities to view' (see Table 2). The launch of poverty strategies or research publications similarly can attract media coverage, although not necessarily the numbers reached by some campaigns.

Table 2: Opportunities to view generated by media coverage

Campaign	Media coverage
One Million Children campaign	2,700 items of media coverage, which overall offered 615 million opportunities to view
Dare to Care campaign	The combined print and web circulation reached in excess of 23.8 million readers and viewers, and the combined weekly reach by TV and radio consisted of 40.3 million individuals
Fair Pay League campaign	Secured coverage in the <i>Daily Mirror</i> (1.5 million copies) and the <i>Sun</i> (three million copies), coverage on the national TalkSport radio channel (two million listeners) and presentation of the campaign during a national TV broadcast with about 2.5 million viewers
The Fair Tipping campaign	Run by the <i>Daily Mirror</i> with its 1.5 million readership. The campaign was later taken over by <i>The Independent</i> (readership around 760,000)
The British Gas/Help the Aged partnership's Winter Deaths campaign	An estimated 120 million opportunities to view during its one-week run on GMTV
Campaign to End Child Poverty by the End Child Poverty coalition	More than 600 references to the campaign and the October 2008 rally were achieved in national, regional and online media between August and October 2008, including a few examples of references in the tabloid press

Our research confirmed the overall findings from recent research⁹ that in general the media do not tend to report on UK poverty because poverty is not seen as 'news'. One interviewee commented that the media are '*operating in a highly competitive and declining newspaper market and need to cover stories that sell*'. In the context of campaigns, interviewees referred to special events or stunts, research findings and government targets or government papers as useful 'hooks' for generating media coverage. For example, End Child Poverty achieved significant media coverage for its Keep the Promise Rally on 4 October 2008 and for the ward-level child poverty figures that were released to the press on 30 September. The timing of events was also seen as important – for example, coinciding with elections or the run-up to Christmas: '*Christmas is an excellent time to campaign on homelessness*'. At a more general level, good relationships with the media were considered to be crucial. The London Child Poverty Commission found that involving an external PR company was particularly effective in generating media interest for its report, evidencing this by comparing media interest for a range of earlier reports.

However, what does media coverage actually achieve in terms of building public support? In most cases, UK poverty stakeholders referred to the *potential* offered by media outreach and to

'opportunities to view' rather than direct evidence of readers or viewers being influenced by the media coverage. Indeed, there is some evidence that even campaigning activities that are highly visible and generate significant media coverage do not automatically increase awareness among the wider public. The market research undertaken by one charity makes for sobering reading in this respect. Despite a significant campaign budget and success in terms of activists reached and media coverage generated, the research concluded that there was no increase in the proportion of people who were aware of the campaign's key UK poverty statistic. The Make Poverty History campaign offers another warning (in an international poverty context). After the 2005 G8 Summit, 87 per cent of the public was aware of the Make Poverty History campaign, but the 'justice not charity' message was not clearly understood by the mass audience, many of whom persisted in believing that the campaign was aiming to raise funds for Africa. The campaign was found to have had a minimal impact on the proportion of people who were concerned about poverty and by 2006 the small positive changes were beginning to slip back again.¹⁰

That being said, there was some clear anecdotal evidence that media coverage could indeed make people sit up and take notice of a UK poverty-related issue.

Evidence suggesting that media coverage can make people take notice

- The Fair Tipping campaign run by the *Mirror* and later by *The Independent* could point to anecdotal feedback referencing that several hundred readers had written to the newspaper saying that it was the first time that they had actually thought about how little waiting staff got paid and that it was an outrage that they did not get the tips either.
- Similarly, angry reactions from football supporters during the phone-in following an interview with the Fair Pay League campaign on TalkRadio suggest that media coverage can make people take notice.
- The Spotlight Life Swap: Diamonds and Dole documentary created significant levels of public debate in Northern Ireland, making it to the BBC Northern Ireland's popular *Nolan* debate and phone-in show. Phone-in reactions varied, however, with some callers commenting negatively about the parent on low income who had participated in the documentary. This shows that the interaction between media coverage and audience reactions remains complex.
- Finally, the Winter Deaths campaign offers direct evidence of the power of television as an outreach medium. GMTV viewers were invited to call in to the programme to request a Winter Deaths campaign greeting card (with free benefit check vouchers), which they could send to an older person; callers could also request a free thermometer. Out of the total of 75,000 cards sent in 2007, 50,000 were distributed via the five-day GMTV campaign. Overall, more than 120,000 free thermometers were distributed by the campaign.

New media

For most UK poverty campaigns, there is little evidence about the relative effectiveness of more

'traditional' online tools (websites, email) and the use of new media (such as Facebook or YouTube) as engagement mechanisms. An exception is the Dare to Care campaign survey of its Facebook members, which showed that more than 60 per cent had invited someone else to join the Dare to Care Facebook site. In principle, Facebook and other social networking sites can generate a self-sustaining dynamics. Facebook users can see which Facebook sites their 'friends' join as 'fans' and this can encourage them to also go and explore the new site and sign up as a 'fan'. There is some evidence (from outside the UK poverty sector) that Facebook sites can indeed see some fairly exponential growth figures.¹¹

Still, membership for Facebook sites of UK poverty campaigns appears to be fairly modest – typically, a few hundred fans or members for the few campaigns where data exists. The End Child Poverty Facebook site is an exception with its more than 3,000 fans. UK poverty campaign Facebook sites do not (yet) appear to reach significantly more individuals than more traditional online supporter engagement mechanisms, such as online petitions. For example, the petition on the End Child Poverty website achieves fairly similar numbers to the End Child Poverty Facebook site (2,500 signatories to the online petition to date). It is possible that the Facebook sites and more traditional online outreach mechanisms reach different audiences, but to date insufficient data is available to test this assumption. The Dare to Care survey of Facebook members suggests that there is a clear *correlation* between Facebook membership and use of the Dare to Care campaign website – 80 per cent of Dare to Care Facebook members indicated that they had visited the Dare to Care website.

Other new media can complement but do not replace more traditional communication channels. Unlike Facebook, YouTube videos and blogs do not have the same direct social networking effect. People still need to be alerted to the fact that a new YouTube video or blog has been posted – for example, by posting the video on the campaign site or referencing the new video in electronic newsletters. RSS feeds can perform this function.

Case studies: use of new media in the public sector

- The Commission for Rural Communities has experimented with a range of new media, including CRC blogs that website users can comment on, YouTube videos and an offer of RSS feeds to subscribers – these feeds allow people to be alerted when new information that is directly linked to their sphere of interest is posted on the CRC website. The RSS feeds are quite popular (about 6,000 subscriptions). The most popular CRC blogs are linked to specific CRC publications (for example, the State of the Countryside report) rather than the CRC thematic blogs. The YouTube video on Financial Inclusion in rural areas has attracted about 70 viewings to date. The CRC’s overall analysis of internet traffic on its site suggests that people tend to be attracted to follow up on something they have already learnt about elsewhere. For example, they may have received the State of the Countryside report and go to the relevant webpage for further data or an electronic copy. New media can complement but do not replace traditional means of communication and in particular active outreach – you still need to attract people to the YouTube channel or blog.
- Similarly, the London Child Poverty Pledge has worked with a YouTube video that shows a practice nurse, a Jobcentre Plus adviser, a childcare manager, an estate manager and an advice worker commenting on how they have contributed to help Chloe and her family escape poverty. The video has attracted about 7,500 viewings to date and is the most popular video on the DCSF YouTube channel. About half of the viewings have been achieved through the DCSF website. Again, placing the YouTube video online in itself does not appear to be sufficient to encourage people to view it. They still need to be alerted to the fact that a new YouTube video has been posted. The

DCSF YouTube channel may be fairly popular in terms of channel viewings (more than 30,000 to date) but only just over 130 people are actually subscribed to the channel and would be alerted to a new DCSF YouTube video being posted. Other individuals would have needed to have been informed about the London Child Poverty Pledge video.

External success factors

Partnership working and champions

Having the support of partners tends to be a characteristic of successful campaigns. A particular benefit of partnership working is that it allows organisations and campaigns to reach out to the supporters and members of other organisations. Examples include the Fair Pay League campaign, which is managed by the Fair Pay Network (16 national organisations), the End Child Poverty coalition with a membership of more than 150 organisations and the Northern Ireland Anti-Water Tax campaign, which saw the Northern Ireland Anti-Poverty Network campaign alongside community groups and trade unionists. The Winter Deaths campaign, jointly managed by DWP, Help the Aged and GMTV, similarly is another clear example of a partnership approach.

The overall view is that success breeds success – seeing that someone else whose views or positions they respect is on board is a good way to get more people engaged. The process ensures that support for the UK poverty agenda becomes ‘expected behaviour’. This can take very different forms, including the following.

- High-level political support – several stakeholders referred to the Prime Minister’s personal support for the child poverty agenda as an important contributing factor to the success of their initiative. Examples quoted also included support for the Child Poverty Commission from the Mayor of London (who was involved in setting up the Commission and attended its conferences) and the London Child Poverty Pledge (he signed the Pledge), and the involvement of the Minister for Welfare Reform at the launch of the London Child

Poverty Pledge. The presence of the local MP, a lord and several councillors during the launch of the Borders challenge document was similarly felt to have raised the profile of the event – there was anecdotal feedback from event participants that they were impressed about the level of attendance at the launch event.

- At local level, the support of elected members or senior officers was seen as crucial in getting the strategy development process started and also in getting other departments or organisations interested in the UK poverty agenda. For example, support from the portfolio holder and the Head of Housing and Social Work Strategy was felt to have helped to make the Borders challenge document a success.
- Aiming for a membership or partnership that encompasses different sectors and individuals from different backgrounds. For example, the 21 commissioners in the London Child Poverty Commission include politicians, voluntary sector representatives, researchers, trade unions and practitioners; staff reported their overall impression that the Commission was generally held in high esteem. The 150 organisations involved in the End Child Poverty coalition cover a wide range of disciplines from faith, education and health organisations to social work and trade unions. Different partner agencies were closely involved in the development of the Child Poverty Solutions Wales toolkit, which meant that these different partners could encourage their local members or local staff to engage with the toolkit after its launch. One indicator of the success of the partnership approach in this context was that partners had offered (unprompted) to write letters of endorsements to the Minister explaining that the development of the toolkit had been an effective process and a genuine partnership. The London Child Poverty Pledge similarly took a broad partnership approach, encouraging its partners to promote the Pledge among their members; several partners referenced the Pledge and the YouTube video on their websites. London Councils

developed a guide on introducing child poverty consideration in the local area agreement process.

- Broad consultation processes – giving all involved a chance to get their views heard – are frequently used to increase buy-in and credibility. This was, for example, the case with the London Child Poverty Commission, which launched a call for evidence that was sent out to 700 stakeholders.
- The Commission for Rural Communities uses a power/influence matrix to identify people in a position to positively affect government policies.
- Stakeholder feedback suggests that celebrity endorsement can be very powerful and most of the case studies that prompt people to act use champions or celebrities. However, champions need to match the values of the cause and at the same time bring in a new voice to the campaign. Give Me Five campaign, for example, had three dedicated champions to reach different audiences: a local sports personality, a TV newsreader and a soap star. Shelter's One Million Children campaign tried to reach the younger demographic through several celebrities, including the comedian Russell Brand. The End Child Poverty campaign was supported by actor and TV presenter Chris Parker as host for the Keep the Promise rally on 4 October 2008. The singer Sophie Ellis Bextor also supported and sang at the rally.

Scale, timing and resources

The research evidence suggests that there is a huge discrepancy in the amounts of funding available for different campaigns and activities, with budgets ranging from less than £10,000 to more than £500,000. Resources do not dictate the effectiveness of any campaigning activity. The successful Living Wage Downing Street e-petition was run by one individual on a voluntary basis; the successful Anti-Water Tax Campaign in Northern Ireland was managed by NIAPN on less than £10,000. Nevertheless, the research findings suggest that financial and staff resources are an important factor in achieving success – in

particular, better resourced campaigns can be significantly more proactive in their supporter engagement techniques and invest in the mix of engagement channels that is required for successful outreach.¹² Moreover, success in resource-poor activities often implies significant opportunity costs for organisers in terms of giving up free time.

Similarly, there is significant variety in the duration of campaign or volunteering activities, with some campaigns lasting only a few months and others stretching over more than two years. The Anti-Water Tax campaign, for example, was first launched in Northern Ireland in 2003 and is still ongoing. There does not appear to be any clear evidence that shorter or longer campaigns are automatically more successful. Stakeholder views varied on this point. Some pointed out that campaigns continue until the required policy change is achieved; periods of more intense campaigning – coinciding with particular events such as elections or with the availability of funding – alternate with lulls in activity. Others felt that it was better to have a relatively short period of intense campaigning than sustain long but thin activity. In both cases, it was felt that it was important to build up momentum towards a clear end goal or, in longer campaigns, towards key milestone events. Special events and stunts can act as ‘hooks’ to encourage supporters to take action and the wider public to take notice. The End Child Poverty Keep the Promise Rally in October 2008 is an obvious example. Events by the One Million Children campaign, including the ‘Wall of Shame’ and the ‘Red Chair’ exhibition, are other examples of such ‘hooks’. Similarly, the London Child Poverty Pledge organised a Child Poverty Summit with about 20 to 30 signatories to date, the Borders challenge document and the Capital Gains report were launched during official events, as was the Child Poverty Solutions Wales toolkit and the Scottish Tackling Poverty Framework.

It remains somewhat unclear whether activity at the local level is more or less efficient than national campaigning. The research has identified effective campaigns at both levels. However, the limited evidence suggests that the most effective national campaigns are those that also have local presence. Local partners can present the grass-root knowledge and stories that are necessary to lend credibility to the campaign and to the advocacy

dialogue with Government. Local groups also play an important role in reaching out to supporters and activists.¹³

Case study: CSV Action Network

The Network is a partnership between CSV and the BBC. The 36 CSV Action Desks based at local BBC radio stations are run by a CSV Community Outreach Manager who works alongside BBC colleagues to help generate content for radio, TV and the internet with a potential reach of ten million people a week. The CSV Action Network invests in relationships and builds contacts that traditional journalists often do not have the time or skills to develop. This allows them access to communities who are often sceptical of the media. Action Desks across the country work with these communities to help them articulate their needs to a wider audience.

The CSV Action Desks supported Dare to Care by using local knowledge and community links to identify the needs of children and their families living in poverty; by running a campaign to recruit volunteers; by publicising Dare to Care activities and events taking place in their region; by offering support to the theme of the month partners; and by setting up projects to help children, young people and families living in poverty. CSV Community Outreach Managers have an established network of 8,500 local partners. In preparation for the campaign, they reviewed existing partners and contacted many new ones, such as local children’s centres and schools. Over the duration of the campaign, the CSV Action Network worked with over 715 local and national partners. Apart from the national partners supporting Dare to Care, strong bonds were established with a large variety of organisations including Home Start, Sure Start and local student volunteering societies, resulting in a significant legacy to the organisations and the campaign.

Group dynamics

Group dynamics were considered to be quite important, particularly in poverty-awareness sessions. Research in the fields of sociology,

communication, psychology, and business and organisational studies has stressed the importance of social norms and 'expected behaviour'. Hearing one person condemn or condone discrimination can influence another person to do the same.¹⁴ Staff feedback confirms that the presence of a strong personality championing a particular view (positive or negative) can significantly alter the tone of discussions in poverty-awareness training. The sessions were felt to work better with existing groups, as opposed to a number of individuals who got together only for the purpose of the training session. Similarly, sessions are more constructive if the trainer can go out and meet the group beforehand and develop a better understanding of its starting position.

Contextual issues

Stakeholders agreed that the wider context was important for an initiative to be successful. For example, it was felt that the Scottish political context possibly makes it easier for the Scottish Government to focus on poverty than it is for the UK Government. The Scottish Government is under pressure from the left side of the political spectrum, the UK Government is under pressure from the right. In Dundee, high levels of deprivation locally – made worse by an administrative change in boundaries – and wide recognition of the problem locally were believed to have facilitated the process of developing the local anti-poverty strategy. In Borders, a strong sense of local community where people know each other was felt to have been an important contributing factor to the success of the Borders challenge paper. The fact that Children and Young People partnerships and Communities First partnerships are looking at child poverty was seen as contributing to interest in child poverty among local authorities in Wales.

Government leadership

Government leadership was considered to be a particularly important contextual factor – it might again be a factor stimulating social norm-setting and making support for the UK poverty messages expected behaviour. Action by the UK Government and Welsh Assembly Government on child poverty was seen as instrumental in getting local government in Wales engaged with the Child Poverty Solutions Wales toolkit. The fact that

Welsh local authorities need to develop a single action plan for children and young people covering seven core aims (similar to the five Every Child Matters aims in England), one of which is poverty, was considered particularly relevant. At a different level, government targets and strategies were also seen and used by the media as hooks for media stories.

Scottish Government leadership on poverty in particular was referenced by several interviewees:

- Scottish ministers and members of the Scottish Parliament (MSPs) were seen as not afraid to openly condemn poverty as morally unacceptable or defend the concept of relative poverty – using 'poverty' language, whereas the UK Government has preferred using less hard-hitting 'social exclusion' language.
- The Scottish Government is the only government in Britain providing core funding to the national anti-poverty network (Poverty Alliance).
- The Scottish Government commissioned Poverty Alliance to run a poster campaign alerting migrant workers to their statutory rights, including the right to a minimum wage. The Tackling Poverty Framework announced a second campaign alerting statutory workers to their wage and leave entitlements. These campaigns were contrasted with DWP campaigns on benefit fraud¹⁵ and the UK Government's repeated mantra of support for 'hard-working families'. This mantra was perceived as having a potentially detrimental impact on public opinion – supporting the view that poverty is caused by people not working hard enough. Interviewees also contrasted the UK Government's explicit and loud support for the Make Poverty History campaign with its stealth approach on tackling UK poverty. More recently, in February 2009, the UK Government launched a £1 million campaign to help agency workers know their rights.
- The Scottish Government has indicated in its Tackling Poverty Framework that it is planning a specific campaign to counter stigma and discrimination against people living in poverty.

This is the only example of an explicit anti-discrimination campaign on poverty identified by the research.

- Finally, the Scottish Government took the initiative in developing a Tackling Poverty Framework and organising a broad stakeholder consultation process around this.

A detailed exploration of why Scottish Government leadership on UK poverty appears to be more pronounced than at UK level is beyond the scope of this research. Stakeholders, however, suggested a number of different possible reasons, including the presence of more sensationalist tabloid press coverage in England and political competition on the left side of the spectrum in Scotland. People also pointed to differences in Scottish society, including the continued influence of cultural (if not religious) Presbyterianism and the cohesiveness and size of society, meaning that Scottish people are able to better understand poverty as it is literally on their doorstep. Scottish people were also felt to be more likely to have closer links to poverty in generational terms. It was considered easier for UK poverty campaigners to generate media coverage because of the smaller Scottish news market. However, robust evidence as to whether Scottish public attitudes to poverty are indeed different is lacking.

6 Conclusions and recommendations

Conclusions

Mapping of activities and what they achieve

The research tried to explore whether and how UK poverty stakeholders are trying to build public support for the UK poverty agenda. The research identified a number of interesting UK poverty initiatives in this respect, but also uncovered useful evidence around what is *not* happening. There are very few examples of initiatives that *actively* and *explicitly* set out to build public support for action on UK poverty – in particular, for potentially unpopular policy measures such as increases in benefit levels for workless individuals. What arguably makes building public support for addressing UK poverty particularly complex is that UK poverty is both a ‘valence’ issue (there is broad societal agreement that poverty is a bad thing) and a ‘position’ issue (there are different opinions in British society on optimal levels of taxation and benefits and the causes of poverty).

The research identified significant activity centred on *informing* people about levels of poverty in the UK and about what it actually means to live in poverty. Examples include poverty-awareness training sessions, the publication and dissemination of research on poverty in the UK and poverty-related documentaries and reality TV. The available evidence suggests that informing people about the prevalence of poverty in the UK and about what it actually means to be poor can be quite effective. There is fairly systematic anecdotal evidence of audiences, readers and recipients of information materials registering their surprise at quite how stark the UK poverty statistics or reality actually are. There is also some anecdotal evidence of information-sharing about UK poverty triggering individuals into wanting to do something about it, in particular donating. There is far less (anecdotal) evidence about information-sharing *alone* leading directly to increased support for the UK poverty agenda, for specific policy measures in

favour of people on low income or for a change in attitudes towards them.

The research has explored a range of *campaigns focusing on particular (policy) measures* in favour of people on low income, such as increases in wage, benefit or support levels. It was particularly interested in campaigns with a strong public engagement component. By and large, these campaigns focus on the particular sub-groups of people living in poverty for whom the public is perceived to have more sympathy, such as children and working people on low incomes. Moreover, the primary aim of most of these campaigns tends to be achieving policy change rather than addressing public attitudes. The public engagement component of the campaigns often focuses on *demonstrating* rather than *building* public support in order to put additional pressure on politicians. The public engagement strategies of these campaigns can reach fairly large groups of people who are willing to register their support for the campaign and of people who are willing to take direct action – sign a petition, join a rally or write to an MP (typically, a few hundred to a few thousand people). Even larger audiences are being reached through media coverage for the campaigns.

Perhaps somewhat unexpectedly, several of these campaigns are relatively effective in reaching out beyond the usual suspects – signing up supporters outside their existing donor base or getting the campaign message across to people who were not previously aware of the particular injustice the campaign is fighting. There is clear anecdotal evidence of audiences getting in touch with the campaigns to register their surprise or outrage at finding out quite how low benefit, wage or support levels are, or quite how stark the reality is for a particular sub-group of people on low income.

There is no hard evidence about the exact proportions of ‘unaware’ people being reached by individual campaigns. However, widespread

stakeholder consensus about the fact that large groups of the population are simply not aware about the extent of poverty in the UK, the anecdotal but consistent feedback about surprise among audiences and the significant reach of these campaigns suggest that their potential in increasing people's understanding and awareness of an issue may well be quite significant. Increased awareness-raising does not automatically lead to increased support for anti-poverty action. However, unlike the first group of initiatives (which are about *informing* people about UK poverty and what it means to live in poverty), information-sharing in a campaign context offers a direct *outlet* for the surprise that people may feel when discovering poverty facts. This gives people who wish to do so a direct chance to show their support in a petition or rally, or by registering on a website or Facebook site. Moreover, the specificity of the campaigns and their focus on absurd or extreme situations of systemic injustice mean that audience reactions are more likely to go beyond surprise and register levels of shock or outrage.

Nevertheless, because of their focus on the sub-groups of people living in poverty for whom the public is perceived to have more sympathy and because they avoid messaging that suggests that the interests of the audiences and the interests of people on low income may not coincide, these campaigns do not necessarily build any public support for more unpopular anti-poverty measures. There is very little or no evidence of individuals who were initially opposed to a particular policy measure but changed their opinion as a result of an advocacy campaign. By and large, campaigns build support by alerting the public to *hidden* issues, rather than tackling *controversial* ones.

There is fairly strong evidence about the value of *volunteering* as a way to provide contact between people on low and higher income. Again there appear to be strong impacts in terms of increased understanding and knowledge about what it means to live in poverty. Volunteering with people on low income in their own communities is arguably the most direct way to experience the power of a real-life case study and make volunteers realise that poverty is not just about money but also about the experience of living in poverty. This was seen as particularly powerful by campaign organisers. Interestingly, the Dare

to Care survey of volunteers suggests that volunteering can be effective not only in increasing awareness, but also in increasing people's support for anti-poverty policy and their belief that individual action can make a difference. The number of volunteers who strongly agreed that it is important for the UK to end child poverty had increased marginally (3 per cent) but there was a 10 per cent increase in volunteers who believed that individuals could contribute to ending child poverty. It is not necessarily the volunteering activity per se, but the direct, informal and interactive contact with people living in poverty that is effective. This opens up the possibility that there may be other methods going beyond volunteering for meaningful engagement between people who are experiencing poverty and those who are not.

Finally, the research identified a range of successful initiatives focusing more generally on *getting poverty higher on the political agenda* or the agenda of other (mainly public sector) organisations. Unlike other campaigns that tend to focus on highly specific policy asks, these activities are more generically trying to get organisations to consider a range of mechanisms and approaches that are all aimed at tackling UK poverty. Approaches include the development of anti-poverty strategies or anti-poverty toolkits, the drafting of anti-poverty challenge documents or the introduction of a dedicated member of staff, unit, agency or external actor as an anti-poverty advocate. The overall impression created by these initiatives is that they can indeed have a fairly strong mobilising effect and be quite effective in creating a certain 'buzz' and 'noise' around UK poverty. Moreover, in many cases, this noise translates in practical commitments of additional staff or financial resources or political capital being spent on tackling UK poverty. These initiatives often succeed in reaching beyond the usual suspects – in particular, because many explicitly set out to reach departments, organisations or colleagues who may not initially think that they have a remit for tackling UK poverty. The 'weakness' of these initiatives in the context of this research is that they rarely have a strong public engagement component and as such do little to build support for UK action among the 'wider' public. Some initiatives succeed in generating significant media coverage for key milestones

(such as the launch of a strategy or a challenge document). However, there was far less if any anecdotal feedback about readers or viewers reacting to this kind of media coverage.

What works?

'Capturing' the audiences

The first step when trying to build public support for the UK poverty agenda is outreach and engagement – catching the attention of the audience. It is at this stage that use of the term 'poverty' can be problematic. 'Poverty' does not 'capture' audiences (other than UK poverty stakeholders) because individuals do not understand its relevance to the UK, to their jobs or to their lives. This means that audience engagement on UK poverty needs to happen:

- through stealth – hiding the poverty message in a format that does not at first appear to have anything to do with UK poverty, such as a tabloid-style free newspaper celebrating diversity that targets London commuters, reality television or information on international poverty;
- focusing on a more specific UK poverty-related issue that people find easier to understand and relate to, such as wage levels, debt or homelessness;
- using a champion – identify someone who is passionate about and committed to tackling UK poverty and is willing and able to convince colleagues, family or friends to engage with the UK poverty agenda.

The most effective mechanisms of outreach (beyond the usual suspects) appear to be the following.

- To have a clear targeting strategy – organising events that are open to the 'wider public' or leaving information materials for the 'wider public' to pick up is likely to attract mainly people who are (already) interested in the topic. Targeting specific groups, not on the basis of their attitudes towards UK poverty, but on a particular interest or activity they

have in common (for example, social workers, employees in one specific company, London commuters, cinema-goers, football fans) can often offer an opportunity to engage people with varying initial levels of awareness, understanding, interest or support for the UK poverty agenda. Moreover, being clear about the target group allows for use of more specific messaging and engagement mechanisms.

- To undertake *proactive* outreach – going out to the target audience rather than waiting for the target audience to discover the campaign, the materials or activities that are taking place; and generally making it easy for individuals to engage.
- To use a mix of engagement mechanisms linking the different mechanisms to the different target audiences one is hoping to reach. Developing materials (leaflets, YouTube videos, a website) or setting up events does not, on its own, engage audiences. They have to be made aware of and interested in the materials or events. Techniques as varied as YouTube or Google ads, lesson plans for schools and offering free thermometers in return for engagement can be effective in encouraging audience involvement.
- The importance of media coverage in reaching out to audiences appears to be confirmed by the research findings, although again the message seems to be that clear targeting and trying to go beyond broadsheet coverage (through channels as diverse as daytime television, tabloid press or sports radio channels) can be effective.
- There is some limited evidence that social networking sites such as Facebook can see the fan base for particular charities growing quite rapidly. However, total numbers of fans for UK poverty-related campaign Facebook sites appear to be fairly modest and the sites do not seem to achieve more than more traditional website-based engagement tools (such as online petitions).

- Partnership working is yet another way of achieving broader audience reach, as partners' supporters or members can be brought into play.

The budget that is available for the activity does not dictate how many individuals will be raised. There are examples of resource-poor activities or campaigns (even activities run entirely on a voluntary basis) reaching significant numbers. However, there does appear to be a link between financial and staff resources available and the width of the engagement mechanisms that are being used. More resources enable organisations to experiment with more varied outreach techniques. Where the budget is more restrained, increased partnership working or activity on a voluntary basis appears to be necessary. In all cases, the challenge appears to be to use the available resources in a well thought through manner on engagement strategies that are able to directly reach the specific target audience.

Getting the message across

The second step, once organisations have succeeded in capturing the audience's attention, is making sure that the message gets across. There again appear to be a number of general principles that can make success more likely.

- By and large, the research confirms the power of real-life stories. There was consistent anecdotal evidence from the vast majority of stakeholders interviewed that real-life stories often lead to *surprise* and sometimes shock or outrage, about how widespread or challenging living in poverty is; it may also lead to donations. Statistics may similarly surprise people but do not to elicit the same emotion in responses. When targeting people in a position to influence decision-making (officials, politicians) real-life stories may strengthen their resolve to take action against poverty or even possibly change their position about the value of a particular policy measure. Real-life stories do not, however, appear to build support for specific policy measures among the wider public. There is very little if any evidence of individuals who initially were against a particular policy measure and changed their views as a result of a story.
- There is a clear need to unpack what 'poverty' means. The messenger needs to make poverty relevant – give examples of the implications of poverty for daily life to make the audience *understand* poverty. Use of budget tools, where the audience is asked to make the kind of budget-allocation decisions a person living in poverty would be expected to make, can be effective. The audience almost inevitably decides that the income that is available is not sufficient to meet daily needs. Showing that people living in poverty are not different from people who are better off can be quite effective. For example, parents living in poverty also want what is best for their children; volunteers may discover that the people on low income they are working alongside support the same football team or like similar music; army personnel may discover that some of their former colleagues are suffering pensioner poverty. However self-evident it may seem that people on either side of the poverty line are fundamentally the same, there does appear to be a tendency to forget this and reconnecting audiences with this truth is necessary¹ In the context of organisational engagement, starting from the organisation's remit and priorities and showing how the poverty agenda links with this remit appears to be the way forward.
- Specific messaging about a specific problem with a clear solution works – audiences want to see that the problem can be solved and want to be part of something that will (potentially) lead to a positive outcome. Messages about injustices that are so obvious that they do not need to be spelled out are particularly effective. For example, the wage differentials between cleaning staff in football clubs or financial institutions and the star footballers or top bankers are so stark as to be absurd. Messages about the people living in poverty for whom the public is perceived to have more sympathy – children, people in work, pensioners – are easier to sell, especially when these individuals can be cast against a 'villain'. There is no evidence, however, that support for

these messages also builds support for more unpopular policy measures for other sub-groups of people on low income.

- As with all communication, the message will get across more effectively if the messenger is someone people trust and whose opinion they respect. Support for the message becomes the norm and the expected behaviour. What this means in practice, however, can vary. The Muslim population may be more likely to trust a message coming from a Muslim charity, a high-level political champion may be important to get staff in public sector organisations involved, the width of the existing partnership base may encourage other organisations to join as they do not wish to stay behind, research evidence can influence individuals seeking objective and independent materials.
- Messaging that does not undermine the audience's own interest or, better still, anti-poverty proposals that are likely to also benefit the audience appear to be significantly more likely to be heard. This presents UK poverty stakeholders with a tricky dilemma. Some of the more unpopular messages are arguably the ones where most activity is required; however, these messages are perceived as going against the interest of audiences.
- Similarly, approaches that do not make the audience feel personally responsible or guilty appear to be preferable. Although the message about the reality of poverty needs to get across, this can be done without preaching and generally keeping things enjoyable. Surprisingly, despite the broad consensus about the importance of keeping a positive slant on things, a lot of the information-sharing about poverty (including stories) focuses on presenting the hardship of living in poverty.

Recommendations

The overall impression is that the collective efforts by UK poverty stakeholders result in a significant pool of surprise and sometimes real shock or outrage about UK poverty or specific UK-poverty

related issues among the British public. This surprise, however, is not always taken forward by the sector to challenge stereotypical images of people living in poverty or to build public support for more unpopular measures targeting people on low income for whom the public is perceived to have less sympathy. To a large extent, this may simply be common sense. Organisations realise that they risk alienating their audiences by bringing up unpopular messages. The few organisations that have tried tackling these issues (for example, the Peanuts for Benefits campaign or discussions in the context of poverty-awareness training) have found that audience and media reactions can go in very different directions to what was initially intended by the organisers. In this context, spending the limited resources that are available on issues where success is more likely in the relatively short time-frames that most funding streams offer appears to be a perfectly logical decision.

Public sector

This may make government leadership and the role of (implicit) government messaging on people living in poverty all the more important. Even in the current economic climate, resource constraints may be less of an issue for governments than for voluntary sector stakeholders. Government ministers may also be in a better starting position to take on the role of 'champion', to influence what is expected behaviour and to attract media coverage. Campaigns to increase benefit awareness, to alert workers to their wage entitlements and to counter stigma and discrimination of people on low incomes send out the message that people living in poverty are worthy of, and have the right to, support and sympathy, and should not be condemned as the 'scroungers' of benefit fraud campaigns who live off the hard work of 'contributing' members of society. The Government carefully chooses its language on asylum-seekers, refugees and migrant workers, seeking to balance the demands of electoral politics with the objective of proactively fostering a diverse and tolerant society. Maybe similar concerns need to become a bigger feature in the Government's communication on unemployment, inactivity and benefits.

Direct government funding for campaigning and advocacy activities may not always be ideal. Voluntary sector organisations that are targeting the Government with their requests for policy change need to keep and be seen to keep their independence. However, these concerns do not apply to a range of other UK poverty-related activities, including poverty-awareness training sessions, the promotion of volunteering opportunities in deprived areas and activities aimed explicitly at empowering people living in poverty themselves. The research suggests that volunteering opportunities in deprived areas can be extremely powerful. Similarly, empowering people living in poverty themselves and poverty-awareness training may be particularly important routes, given that advocacy campaigns tend to focus on messages that are easier to sell and to target sub-groups of people on low income for whom the public is perceived to have more sympathy. Poverty-awareness training, although by no means always successful in changing participants' opinions for the better, at least tackles the thornier issues and offers a space to openly discuss attitudes and stereotypes.

The research has found that Poverty Alliance is the only anti-poverty network in the UK to receive core funding from the (Scottish) Government. Although concerns about funding and resources were raised consistently by third-sector organisations, resource constraints appeared most acute and severe among the anti-poverty networks, which often depended to a much larger extent on the inputs of volunteers. These networks also raised their frustrations about not being able to follow up on any of the initiatives and ideas coming from people living in poverty after an initial empowerment activity.

Similarly, there should be no difficulties for the Government to provide funding to help track and monitor achievements, such as, for example, subsidies to cover the cost of subscription to Charity Awareness Monitor for smaller organisations.

Voluntary sector

This does not mean that the voluntary sector can do nothing. What is almost entirely absent from the voluntary UK poverty sector is argumentation based on countering the *valid* concerns and claims

of people who are not unequivocally in favour of an increase in wage, support or benefit levels. Audiences may reasonably wonder whether an increase in minimum wage levels would not have negative impacts on employment levels or small businesses' ability to compete in the market place, or whether an increase in benefit levels would not have negative impacts on employment levels. The UK poverty sector may at times appear too ready to dismiss these claims as stereotypical discourse from individuals who do not realise what it is like to live on benefit or on the minimum wage. Following the 2005 Gleneagles G8 and Make Poverty History, the international poverty sector faced increased concerns from the British public about levels of corruption in aid delivery – they had to acknowledge the existence of corruption and develop counter-arguments. Maybe the UK poverty sector needs to try experimenting with a similar approach: acknowledging the challenges of increasing wage, support and benefit levels; exploring in some detail quite how real and how important these challenges are; and developing well evidenced counter-arguments. When the Fair Pay League campaign encountered football supporters' concerns that the introduction of a living wage in the premier league might increase their ticket price, the Fair Pay League did not, at this point, appeal to football supporters' conscience with stories about the hardship experienced by cleaners and other staff. It acknowledged the concern and retorted by quoting the percentage that ticket prices had gone up in previous years – not as a result of the introduction of better wage conditions for cleaning staff but closely correlated to increases in pay and bonuses for management.

Similarly, there is scope for voluntary sector organisations to explore more opportunities for joint working. Sharing supporters and referencing each other's campaigns will always be a challenge, as organisations are understandably afraid that support for another organisation's campaign will result in supporters reducing or removing their donations to support the new cause. This should be less of an issue for membership networks or organisations that do not currently depend to any great extent on donations from individual members of the public for their activities. There is already a significant element of partnership working in many

of the UK poverty campaigns that are currently running. For example, different End Child Poverty coalition members had a stall on Trafalgar Square during the End Child Poverty Keep the Promise rally offering rally participants an outlet for taking their campaigning energy and enthusiasm forward. Similarly, campaign websites sometimes refer to partner websites. Nevertheless, there appears to be relatively little explicit and direct encouragement to sign petitions or attend events organised by other organisations.

Several online companies have developed smart marketing techniques suggesting a limited number of additional items a buyer might also be interested in. Nothing prevents charities from developing a similar menu of petitions to show to recent signatories of one particular petition. Crucially, such a menu would also offer an opportunity to link specific campaign messages about particular problems and specific sub-groups of people living in poverty to the wider UK poverty agenda. At one level, this is already happening through social networking sites. Charities and individuals are posting messages on the 'walls' of Facebook campaign sites asking fans of this particular site to consider joining a different group or signing a different petition. Rather than passively waiting for others to 'poach' their 'fans', charities may as well take a more proactive approach in signposting their supporters to other relevant campaigns and linking up their campaigns – making supporter engagement easier for the sector as a whole.

There appears to be particular scope for strengthening collaboration between, on the one hand, the different anti-poverty networks and, on the other hand, the voluntary sector organisations engaged in campaigning on specific policy issues and to specific target groups. The success of issue-specific campaigns lies in their reach (often several thousand individuals); the added value of a lot of the work of the anti-poverty networks lies in their depth (going beyond the people living in poverty for whom the public is perceived to have more sympathy and being able to unearth and challenge negative attitudes towards people living in poverty).

In addition to deepened co-operation within the sector, there is potential to expand cross-sectoral partnership working between the

voluntary sector and private sector in particular. Business in the Community Business Action on Homeless and Seeing is Believing initiatives illustrate that there is a will and aspiration to actively support anti-poverty activity among the private sector; employer-led volunteering schemes have become a core part of many corporate social responsibility strategies. The UK poverty sector should proactively tap into these aspirations by building awareness and contributing its knowledge base and links with local people experiencing poverty to employer volunteering schemes and other initiatives in favour of people on low income developed or considered by businesses.

Funders

The Critical Masses report² already makes a strong case for increased financial support from donors for social campaigning. The report suggests that, in funding campaigning, ambitious funders can make a difference not just to their sector, but also to the way charities work by encouraging collaboration, funding, monitoring and evaluation, pushing for beneficiary involvement in campaigning and influencing their peers.

This research report suggests a number of practical ways in which funders can go about this. In particular, they can encourage charities to be more explicit about the aims and objectives of the public engagement components of their campaigns and to no longer accept vague references to raising 'public awareness' or challenging 'public attitudes' to UK poverty. Funders can demand that charities put in place the tracking and monitoring mechanisms required to evidence outputs or intermediary outcomes either by directly providing financial support for the tracking and monitoring mechanisms to be put in place or by guiding charities to free-access monitoring mechanisms available. Many funders, to their credit, are placing a strong focus on evaluation. However, all too often, evaluation is interpreted by organisations as an afterthought, built on the basis of data and findings that happen to be available when the frantic campaigning activity has come to an end and overworked staff are finally allowed some time to take a step back to consider their achievements. Placing a stronger focus on *monitoring* in real time may well be one small element that can support the

cultural change required to get charity staff to think about effectiveness and impacts throughout the lifetime of an activity. Funders would also do well to be realistic in their expectations of what can be achieved in terms of building public support for the UK poverty agenda within short timetables. Succeeding in engaging people in a dialogue about controversial issues, irrespective of any outcomes of this dialogue, may well need to be considered an important achievement. This report also provides funders with some preliminary benchmarks around what can reasonably be expected of campaigns in terms of supporter reach.

Building public support for the UK poverty agenda remains a challenge. Closer attention to implicit government messaging on poverty, increased funding for support building activities, closer collaboration between voluntary sector stakeholders and a review of arguments and communication strategies used may go some distance towards beginning to address that challenge.

Notes

Chapter 1

- 1 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007). The research runs parallel to a complementary piece of PIPI research – building on earlier findings that real-life stories work, Durham University is looking at how people living in poverty can be supported to participate in the media and new media.
- 2 *Attitudes to Poverty: Findings from the British Social Attitudes Survey* (Park *et al.*, 2007).
- 3 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007).
- 4 Centre for Migration Policy Research, 'Understanding and changing public attitudes: a review of existing evidence from public information and communication campaigns' (Barrow Cadbury Trust, City Parochial Foundation, Princess of Wales Memorial Fund, Joseph Rowntree Charitable Trust, Paul Hamlyn Foundation, October 2008, unpublished).
- 5 *Critical Masses: Social Campaigning, a Guide for Donors and Funders* (Lofgren *et al.*, 2008). The report argues that many of the concerns of donors and funders (that campaigning takes too long, that it is risky, that its legality is uncertain and that it is difficult to know whether or not the campaign has made a difference) are exaggerated.
- 6 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007).

- 2 See Appendix 2 for more detail about Dare to Care, Business Action against Homelessness and Fit4Finance.
- 3 See Appendix 2 for more information about the Anti-Water Tax campaign, the Campaign to End Child Poverty, the Debt on our Doorstep campaign, the Destitution campaign, the Fair Pay League, the Fair Tipping campaign, the Give Me Five campaign, the Living Wage online petition and the One Million Children campaign.
- 4 See Appendix 2 for information about *The Big Issue* and the Winter Deaths campaign.
- 5 See Appendix 2 for more detail about the *Tackling Poverty in the Scottish Borders* challenge paper, the London Child Poverty Commission's *Capital Gains* report, Child Poverty Solutions Wales, the Commission for Rural Communities, Dundee's Local Anti-Poverty Strategy, the Gateshead Housing Company's Anti-Poverty Strategy, the DWP/DCSF Child Poverty Unit's London Child Poverty Pledge and Business in the Community's Seeing is Believing programme.

Chapter 3

- 1 A limited number of evaluation stakeholders interviewed reported interesting examples of attempts to facilitate a process of changing organisational culture. For example, Evaluation Support Scotland offers a consultancy service operating alongside voluntary sector organisations in trying to design or improve

impact assessment procedures; Oxfam has recently appointed a member of staff with a remit for trying to encourage and support monitoring and evaluation – Oxfam already had evaluation capacity; what is new about this post is its focus on encouraging organisational change.

- 2 Previous JRF reports from the PIPI programme were quoted a number of times.
- 3 The MORI poll showed that there was no change.
- 4 Examples include a Welsh Assembly Government audience segmentation study around climate change, a series of focus groups around public perceptions about international poverty funded by the Department for International Development (DFID) and the audience segmentation work by a limited number of charities to understand their donors and improve fundraising.
- 5 One example mentioned was Advocacy Online software (www.advocacyonline.net).
- 6 For example, www.limesurvey.com and www.surveymonkey.com (free access up to ten questions).

Chapter 4

- 1 Centre for Migration Policy Research, 'Understanding and changing public attitudes: a review of existing evidence from public information and communication campaigns' (Barrow Cadbury Trust, City Parochial Foundation, Princess of Wales Memorial Fund, Joseph Rowntree Charitable Trust, Paul Hamlyn Foundation, October 2008, unpublished).
- 2 *Attitudes to Poverty: Findings from the British Social Attitudes Survey* (Park et al., 2007).
- 3 CSV, Dare to Care end of project report (2008).

Chapter 5

- 1 *A Minimum Income Standard for Britain: What People Think* (Bradshaw et al., 2008).
- 2 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007).
- 3 *Public Attitudes to Economic Inequality* (Orton and Rowlingson, 2007).
- 4 As reported by the Centre for Migration Policy Research, 'Understanding and changing public attitudes: a review of existing evidence from public information and communication campaigns' (Barrow Cadbury Trust, City Parochial Foundation, Princess of Wales Memorial Fund, Joseph Rowntree Charitable Trust, Paul Hamlyn Foundation, October 2008, unpublished).
- 5 *Asylum: Understanding Public Attitudes* (Lewis, 2005).
- 6 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007).
- 7 *The Media, Poverty and Public Opinion* (McKendrick et al., 2008).
- 8 *Understanding Attitudes to Poverty in the UK: Getting the Public's Attention* (Castell and Thompson, 2007).
- 9 *The Media, Poverty and Public Opinion in the UK* (McKendrick et al., 2008).
- 10 Andrew Darnton, 'Make Poverty History: end of year notes' (Department for International Development Public Perceptions of Poverty programme, April 2006).
- 11 In November 2008, the research team recorded the membership numbers of the Facebook sites of a selection of UK charities in a preliminary attempt to develop some broad

benchmarks for the popularity of dedicated UK poverty campaign sites. By January 2009, the membership of a number of these Facebook sites had grown quite significantly, in some cases more than doubling.

- 12 A number of organisations asked for their campaign budgets not to be made public, which prevents us from presenting a more detailed analysis of the links between budgets and, for example, numbers reached.
- 13 For example, Dare to Care and Give Me Five were both national campaigns, but their links with and outreach to local groups contributed to making the campaigns a success.
- 14 Centre for Migration Policy Research, 'Understanding and changing public attitudes: a review of existing evidence from public information and communication campaigns' (Barrow Cadbury Trust, City Parochial Foundation, Princess of Wales Memorial Fund, Joseph Rowntree Charitable Trust, Paul Hamlyn Foundation, October 2008, unpublished).
- 15 Which are felt to be more visible than DWP's benefit take-up initiatives (such as its involvement in the Winter Deaths Campaign).

Chapter 6

- 1 This supports the theory proposed in Ruth Lister's (2004) book *Poverty* that audiences are used to 'othering' people living in poverty – placing a distance between themselves and the people living in poverty – and that this barrier needs to be broken down.
- 2 *Critical Masses: Social Campaigning, a Guide for Donors and Funders* (Lofgren et al., 2008).

Appendix 1: Research methodology

The research consisted of two phases: a wide stakeholder consultation; and the development and analysis of a limited number of in-depth case studies.

Wide stakeholder consultation

Between July and September 2008, 105 individuals were interviewed over the telephone, including:

- 32 voluntary sector organisation representatives;
- ten staff from funding bodies;
- 32 individuals from the public sector;
- twelve staff from private sector companies and three other private sector stakeholders;
- eleven staff from research institutes involved in awareness-raising on poverty and five staff from institutes involved in supporting impact assessment of awareness-raising activities.

The discussion centred on three key questions.

- What approaches has the organisation used to try to increase awareness and involvement in anti-poverty activities and initiatives in favour of people on low income?
- Has the organisation undertaken any evaluation of this?
- What, in their experience, 'works' in building support for the anti-poverty agenda?

Our overall approach to the research was to try facilitating a process of reflection. We encouraged stakeholders to think about what they believed 'works' in building public support for the UK

poverty agenda and their reasons for believing this. The process of identifying and selecting interviewees has largely been an organic one, following up stakeholders' own leads and suggestions as to who else to contact. The starting point was a small number of key umbrella and support organisations and key players.

Development and analysis of in-depth case studies

The second stage of the research consisted of case study analysis. Twenty-nine initiatives and projects were selected, capturing the diversity of support-building activities taking place in the UK. These 29 initiatives were written up as separate case studies. The completed case studies were then used as the basis for a follow-up interview with stakeholders.

The case study development followed a fairly strict case study template. For each case study, the research tried to assemble the following.

- General background information about the initiative.
- A sense of the overall achievements of the activity interpreted in terms of building public support for the UK poverty agenda. It is important to stress that the research did not assess the initiatives on their achievements in relation to their primary aims and objectives; the focus was on their contribution to building public support for action on UK poverty.
- Lessons around what 'works' in building public support.
- The evidence base available for the activity.

Unsurprisingly, the scoping phase found that few if any initiatives or organisations could be considered to be offering 'good practice' across the board. Individual actions rather stand out because of one particular successful aspect. In some cases, the initiative had finished and had been evaluated, but some promising new initiatives or activities without any detailed evaluation evidence as such were also identified. For each of the case studies,

the research team tried to explore as much as possible all available evaluation evidence, including evaluation reports, monitoring data and samples of partner or audience feedback. However, the team did not undertake any primary evaluation research – all evidence presented in the report is evidence provided by the host organisations.

Living with Hardship 24/7 research report

(Lead) organisation(s)

National Society for the Prevention of Cruelty against Children, University of York and the Frank Buttle Trust

Aim

The aim of the research was to explore the relationship between living on a low income and parenting, with the objective of influencing and improving service provision for families on a low income.

Building public support for the UK poverty agenda

The launch of the report was explicitly aimed at raising awareness of child poverty. The report aimed to influence policy-makers and practitioners into improving service provision for families on a low income.

Timing/scale/resources

The research started in September 2004; the report was launched in November 2007. The research was funded through the Big Lottery Fund (£181,389). The research was commissioned by the Frank Buttle Trust.

Achievements

- Reaching beyond the usual suspects (in terms of families living on low income included in the research: families whose first language was not English, families in contact with social services because of child protection issues).
- Generating media coverage.
- Raising awareness (making people realise how challenging it is to live in and bring up children in poverty).

What works

- High-level political support: launch of the report by the Chancellor of the Exchequer, foreword by the Prime Minister.

- Partnership working: launch of the report as part of the End Child Poverty campaign's Month of Action.
- Wider context of increased interest in child poverty.
- Term 'low income' was used in the research with participants to avoid the stigma associated with poverty; in the report itself, the term 'poverty' was used.
- Presenting people with information about how challenging it is to live in poverty, for parents and children.
- Real-life stories (based on face-to-face interviews with people living in poverty, including both parents' and children's views and experiences) and use of case studies and quotes.
- Diverse sample, including families on a low income in affluent areas as well as in areas of high deprivation, and from diverse ethnic backgrounds.

Evidence

- Collation of media coverage and reviews of the report.
- Comparison with media coverage received for other research reports.
- Media requests for real-life stories (and statistics).
- A number of invitations to present the research findings during conferences or contribute an article about the findings in a magazine.
- Feedback from a small number of academics that the report was useful.
- Reaction from the launch audience that they did not realise how challenging it is to live in and bring up children in poverty.

- Radio interviews generated further discussion (phone-in) – mainly people calling in to present their own problems of coping on a low income.

Annual Islamic Aid brochure (one page on UK poverty)

(Lead) organisation(s)

Islamic Aid

Aim

The overall aim of sending out an annual brochure is to inform the UK Muslim community about the work of Islamic Aid and encourage people to support the charity.

Building public support for the UK poverty agenda

Dedicating one page in the brochure to UK poverty was done with the explicit objective of raising awareness about poverty in the UK in the Muslim community.

Timing/scale/resources

Introducing UK poverty in the brochure was done about five years ago. No additional funds were invested. The brochure was already being produced and had been distributed since 2000 (but previously focused only on poverty abroad). A separate, more detailed background document on poverty and social exclusion among the British Muslim community was also developed. Islamic Aid is run on a voluntary basis.

Achievements

- Reaching beyond the usual suspects (the annual Islamic Aid brochure is sent to about 500,000 Muslim households; the more detailed background document on poverty and exclusion was sent to about 35,000 Islamic Aid supporters/donors).
- Raising awareness (awareness about the prevalence of UK poverty).
- Changing attitudes (increased concern about the prevalence of UK poverty).
- Changing behaviour (people starting to talk about poverty in the UK, demanding action on poverty in the UK, forwarding information to others).

What works

- Link with international poverty is not problematic – the starting point was precisely and explicitly that poverty does not just exist in other countries.
- Importance of sharing information: use of key statistics on UK poverty in the British Muslim community – the same statistics are being repeated each year in the brochure.
- Use of government statistics on poverty and exclusion makes it easier for recipients to copy and use the figures, as they are confident about their reliability.
- Peer pressure – a Muslim organisation reaching out to the Muslim community (messages from other stakeholders about problems in the Muslim community are often perceived as a negative or stereotypical portrayal of Muslims).
- Pragmatic approach (given resource constraints and the scale of the challenge): taking a small step (including a page on UK poverty) and focusing on awareness-raising – before considering any practical initiative aimed at tackling UK poverty.

Evidence

- Staff perceptions that UK poverty is now more talked about in the Muslim community.
- Other charities and the Muslim media are using the same five poverty and social exclusion statistics that Islamic Aid quotes in its brochure.
- Islamic Aid emails are being forwarded by email recipients – Islamic Aid knows this because it is on the mailing lists of other organisations and has been sent its own UK poverty materials back by other organisations.
- Recipients' feedback (about 200 people calling every year in the month after the Islamic Aid brochure has been sent out). People report

that they did not realise how bad the situation was; some people also ask Islamic Aid what it is doing to tackle poverty in the UK, whereas previously the organisation had found it very difficult to get any support (donations) for UK poverty.

www.islamicaid.org.uk

The New Londoners newspaper

(Lead) organisation(s)

Migrants Resource Centre

Aim

The project offers migrants and refugees a direct line of communication with the public by giving them an opportunity to produce their own newspaper. It aims to dispel some of the myths around refugees and migrants created by mainstream media.

Building public support for the UK poverty agenda

The destitution faced by (some) migrants and refugees is one of the issues the newspaper addresses. Other issues include detention of asylum-seekers, the voucher scheme for refused asylum-seekers and positive contributions that migrants and refugees make.

Timing/scale/resources

Two editions have appeared so far (June 2007, June 2008); further editions are being planned (June 2009, June 2010). The paper is produced on a voluntary basis and supported by a range of organisations. City Parochial Foundation, UNHCR (the UN Refugee Agency) and Oxfam have provided financial support. A Migrants Resource Centre employee supports the project.

Achievements

- Reaching out beyond the usual suspects (100,000 free copies hand-delivered at more than 25 London stations during rush hour, creating a multiplier effect with newspapers being left on the train for others to read; also distribution at schools, libraries, police stations and other locations and a mail-out to MPs).
- Getting people to act (people volunteering to produce the paper).
- Generating media coverage (including on BBC London).
- Raising awareness (people report their shock about refugees' circumstances).

- Changing behaviour (people offer money and in-kind support, volunteer as a result of reading the paper).

What works

- A gentle approach – not making people feel bad or personally responsible.
- Staying away from using any terminology referring to poverty or destitution – the information about destitution is presented through human interest stories.
- Easy-to-read, tabloid-style articles – mainstream appeal.
- Use of celebrities (articles/interviews with Angelina Jolie and Colin Firth).
- Real-life stories – the articles are written by refugees, based on their experiences.

Evidence

- Feedback from readers through email and letters (a few dozen in 2007 and 2008), by phone and from people walking into the Centre. People offer to donate to the Hardship Fund (unprompted), to volunteer or to provide support (four people offered accommodation to an asylum-seeker featured in the paper), or comment on the paper (a GP explained that he told all his patients about the paper).
- *The New Londoners* article written by Mark Haddon (with real-life stories) quoted most often in readers' feedback.
- Migrants Resource Centre being asked to speak at conferences.
- More than 50 people volunteered to produce the paper.
- Awarded with Highly Commended prize in the Mayor of London Press Awards 2007 ('Best coverage in black and minority ethnic press' and 'Best visual/creative material').

Poverty and Homelessness Action Week

(Lead) organisation(s)

Developed by the Church Action on Poverty with its partner organisations (Housing Justice, Church Urban Fund, Get Fair, Scottish Churches Housing Action)

Aim

Change local attitudes on poverty and raise awareness of homelessness in its own local communities.

Building public support for the UK poverty agenda

The Action Week is directly building public support for the UK poverty agenda.

Timing/scale/resources

Annual one-week campaign each February since 2008.

Achievements

- Raising awareness and getting people to act. Exceeded targets in 2008 and 2009 with over 100 local events held each year, from full-scale poverty and homelessness hearings and drama performances down to simple church services and group meetings.
- Reaching beyond the usual suspects – particularly effective was the location of events in small and rural areas, and some in affluent areas, as well as using alternative communication methods (e.g. drama).

What works

- Having a local champion – use of local (predominantly faith) organisations and volunteers to set up events for the national campaign.
- Direct contact – local people recruited by local projects talked about their experiences of poverty and homelessness.

- Using the term ‘poverty’, but in the local context.
- The campaign was co-ordinated nationally but delivered by local organisations tailored to the local setting.

Evidence

- Patchy feedback, centred on asking all the local event organisers to report back. Based on this (predominantly descriptive) evidence collated by local volunteers, a small summary of achievements was published.
- Anecdotal evidence of good take-up and attendees including local power-holders (councillors and MPs).
- Press cuttings and anecdotal evidence of ‘a lot’ of local media coverage.
- The target number of events exceeded in first two years of operation.

www.actionweek.org.uk

Poverty-awareness training (social workers)

(Lead) organisation(s)

King's College London

Aim

The aim of the poverty-awareness training is to raise social workers' awareness of what it means to be a poor parent.

Building public support for the UK poverty agenda

Yes – awareness-raising is a direct objective of the training. The target group are social workers (as opposed to the wider public).

Timing/scale/resources

The training originated about five to six years ago as a collaboration project between King's College London and ATD Fourth World, which led to the development of a poverty-awareness training pack for practitioners. About 500 social workers have been trained to date and the training is ongoing. Training is paid for through local authorities' subscription fee to the Making Research Count programme, which aims to make research available to practitioners.

Achievements

- Getting people to participate in activity (people choosing to attend the training, local authorities choosing to pay for the training).
- Raising awareness (social workers understanding better what it means to be poor).
- Changing attitudes (social workers understanding better what it means to be poor).

What works

- Offering poverty-awareness training as part of an existing training packet (this is one of 60 courses that post-qualifying social workers can take and claim credit for).

- Importance of group dynamics – reactions from participants depend more on the balance of the group than the facilitator.
- Use of poverty terminology during session (the meaning is clearer) – but poverty terminology is less effective in attracting people to attend an event.
- Poverty-awareness training takes time (the sessions are three hours). It is necessary to unpick the experience of poverty – most social workers do not have any real experience of poverty themselves.
- Real-life case studies – the training sessions include presentations by families experiencing poverty; there are also interviews with families in the e-learning module.

Evidence

- Attendance is lower when organised as a free-standing event.
- Only about 30 social workers showed up for a conference on poverty (compared to about 200 for a conference on neglect).
- Feedback forms and discussion with participants after the first phase of the training: the majority of participants feel that it has been a sobering and important message; a significant minority are angry and feel that the families' experiences are not representative or are presenting only part of the story.
- Anecdotal feedback on the e-learning module: family interviews are what works.

Poverty-awareness programme

(Lead) organisation(s)

Northern Ireland Anti-Poverty Network (NIAPN)

Aim

The programme aimed to support disadvantaged people in Northern Ireland by training them around how poverty affects their communities and what can be done about it.

Building public support for the UK poverty agenda

The project targeted disadvantaged people but participation in the training was wider than only people on low income.

Timing/scale/resources

The programme ran for three years between May 2005 and June 2008 in partnership with and with funding from Save the Children and Big Lottery. Funding was provided for one full-time development worker and for line management and administrative support.

Achievements

- Reaching out beyond the usual suspects (training sessions held with community and church groups, schools, Sure Start and Jobcentre Plus staff and others).
- Getting people to participate in activities (getting groups/individuals to participate in up to four half-day modules of the training session).
- Raising awareness (participants increasing their knowledge of poverty).
- Changing attitudes (participants becoming more confident discussing poverty).
- Changing behaviour (people joining NIAPN and setting up anti-poverty support groups or support programmes as a result of the training session).

What works

- A range of channels to promote the sessions including leaflets, information days, information-sharing to the network of contacts and members, word of mouth.
- Having a local champion – someone willing to promote the training to colleagues.
- Holding a session with a pre-existing group.
- ‘Personalising’ the sessions, making it relevant to groups’ own priorities, going out to meet the group before the training session.
- Participants with previous experience of poverty often respond more positively.
- Using the term ‘poverty’ but explaining what is meant by it.
- Participatory dimension of the training (people retain the knowledge better).
- Poverty trap game (fun and ‘making the point better than any amount of talking’).
- ‘Budgeting for poverty’ tool, challenging participants to make a low budget work.
- Media work: involvement in the BBC Spotlight documentary *Life Swap: Diamonds to Dole*, which followed a mother on a low income swapping lives with a business woman for one week – now used by NIAPN as a video training resource.

Evidence

- Detailed and comprehensive formal evaluation report by an external evaluator.
- Monitoring data: training was offered to 15 groups and 522 individuals.
- Evaluation booklets: 13 (of 41) participants consider themselves poor.

- Feedback forms: participants feel more confident discussing poverty and know better what they can do locally to combat poverty as a result.
- Focus groups: confirmation of the value of the poverty trap game.
- Case studies and follow-up questionnaires: examples of support groups or support programmes being set up and individuals joining NIAPN.
- Spotlight documentary *Life Swap: Diamonds to Dole* created public discussion (including discussion during the BBC's *Nolan* debate and phone-in show).
- Staff experience of what generates (positive) debate during training sessions.

Further information

Frances Dowds, Director, NIAPN

www.niapn.org/index.php?option=com_content&task=view&id=4&Itemid=61

Poverty-awareness training

(Lead) organisation(s)

Culture and Sport Glasgow (City of Glasgow) and Poverty Alliance

Aim

The aim of the training is to:

- increase participants' understanding of the relationship between inequality and poverty, and how poverty impacts on people's lives;
- enable participants to identify ways in which they can provide an effective service to people who experience poverty.

Building public support for the UK poverty agenda

Yes – the aim is to develop a better understanding of poverty and change attitudes towards people on low income.

Timing/scale/resources

Six one-day training sessions run by Poverty Alliance and funded by Culture and Sport Glasgow. Most participants were front-line staff; about ten staff participated per session. The sessions were facilitated by a Poverty Alliance fieldwork officer and an external consultant.

Achievements

- Reaching out beyond the usual suspects (local authority staff – irrespective of their initial awareness and attitudes towards poverty, and people experiencing poverty).
- Getting people to participate in an activity (participate in training, fund the training).
- Raising awareness (increase participants' understanding of poverty).
- Changing attitudes and changing behaviour? (Difficult to measure.)

What works

- Word-of-mouth publicity about poverty-awareness training sessions.
- Having a champion: a member of staff willing to encourage the organisation to commission the training and get colleagues to participate.
- Challenge perceptions but avoid preaching: tackle the issue, not the person.
- Use of the word 'poverty' is not automatically a problem (training advertised as poverty-awareness training).
- Arguments based on the wealth gap (rather than welfare reform).
- Quiz with multiple-choice options on poverty statistics.
- Real-life stories work (coupled with research), bringing in not only people experiencing poverty. Alternatives are, for example, staff talking about stories, using quotes (from community empowerment projects or research), using scenarios, etc.
- Use of a family spending chart showing how difficult it is to make a low budget work.
- In-depth exploration of the issues in a small group. Group dynamics make a difference: people sometimes challenge each other.

Evidence

- Market research (survey, focus groups) showed that there was a potential demand for more poverty-awareness training. Led to the development of new materials and changes in the organisers' approach – for example, a multiple-choice quiz on poverty statistics rather than presenting facts at the start (which led to some people losing interest).
- An external evaluator observing the Culture and Sport Glasgow training session and making recommendations for change.

- Local authorities taking the initiative to contact Poverty Alliance for training and being willing to pay for the training.
- Number of people participating: in Glasgow, six sessions with about ten people in each session.
- Participant feedback: the dry presentation of statistics was considered boring.
- Feedback forms: responses to impact questions indicate that existing views are being reinforced or that people learn new information and develop new insights.
- Staff experience that real-life stories result in better reactions from politicians.
- Anecdotal evidence of change in practice: the museum display on poverty in Glasgow was updated as a result of the training.

Anti-Water Tax campaign

(Lead) organisation(s)

Northern Ireland Anti-Poverty Network (NIAPN)

Aim

To prevent the Northern Ireland Assembly from introducing a charge for household water and sewerage services.

Building public support for the UK poverty agenda

Building public support for the poverty agenda was not the primary aim of the campaign (preventing the introduction of a water tax was). However, NIAPN focused its message on the impact the charge would have on people on low income.

Timing/scale/resources

NIAPN has been campaigning against the introduction of a water tax since 2003, alongside the Coalition against Water Charges, Communities against the Water Tax, the We Won't Pay campaign and others. Financial resources are limited and a lot is done on a voluntary basis.

Achievements

- Reaching beyond the usual suspects (a wide coalition with mass appeal).
- Getting people to participate in an activity (people displaying campaign stickers on their cars, participating in demonstrations outside Stormont).
- Generating regular media coverage (including the BBC's *Nolan* phone-in show).
- Changing attitudes (increased resistance to water charges – only implicit evidence).
- Changing behaviour (water charges postponed for a year in 2007 and 2008).

What works

- Wide coalition of organisations and groups involved (community groups, trade unions, anti-poverty groups, older people).

- Involvement of people living in poverty – the campaign started in the most disadvantaged areas.
- Campaign around a specific issue with a clearly identified solution.
- 'No-brainer' message: Northern Ireland already pays for its water through the household rates; water charges would mean paying twice.
- Everyone stands to gain something (not having to pay water tax): the interest of people on low incomes coincides with the interest of the wider public.
- Humour: use of 'Computer says no' (*Little Britain*) T-shirts.
- Wide distribution of campaign materials (including stickers to put on jackets/cars).
- Informing politicians about the proposals' impacts on people on low incomes (contrasting the £5 per week charge to a total income of £45 per week).
- Campaign activities were organised to coincide with elections: candidates were keen to attend community events; voters were keen to engage with politicians.

Evidence

- Staff views that campaign stands out as successful (compared to other campaigns).
- Success (water charges postponed in 2007 and 2008; all political parties have declared their support), despite the message from bigger charities and groups early on that water charges were coming and that nothing could be done about it.
- 2007 Consumer Council report *Water and the Consumer: Driving for a Fair Deal* indicating that three-quarters of people oppose water charges; 100,000 individuals have pledged to refuse to pay (reported by the We Won't Pay campaign).

- More than 10,000 campaign stickers were distributed by NIAPN – car stickers were more popular than stickers to put on jackets.
- Campaign had been going since 2003 but really gained momentum in the run-up to the elections – supporting the importance of the timing of the campaign.

Campaign to End Child Poverty (ECP)

(Lead) organisation(s)

End Child Poverty coalition

Aim

The overall aim of the ECP campaign is to eradicate child poverty.

Building public support for the UK poverty agenda

Building and demonstrating public support is a key part of the ECP strategy to increase pressure on the Government to meet its targets to eradicate child poverty.

Timing/scale/resources

ECP was launched in 2002 and is currently ongoing. The ECP Network has more than 150 member organisations. All members pay a membership fee; six large members currently provide the bulk of the funding. Staff resources have varied between two and seven, and two interns; currently there are four staff.

Achievements

- Reaching out beyond the usual suspects (organisations not previously involved in child poverty or children's issues).
- Getting people to participate in activity (getting members and supporters to promote, contribute towards and attend the ECP rally on 4 October 2008; getting the wider public to attend the rally on 4 October 2008 or register their support online).
- Generating widespread media coverage.
- Raising awareness and changing attitudes (putting child poverty higher on the agenda of organisations and politicians).

What works

- Positive messaging – people want to join something that will be successful.

- Fun, carnival atmosphere at the rally on 4 October 2008.
- Celebrity voices (singer Sophie Ellis Bextor and presenter Chris Parker at the rally).
- Partnership working – what works in membership engagement is showing how child poverty relates to the organisations' own priorities and allowing members to be involved in developing campaign policy and activities. Having different types of membership (different fees) allowing small organisations to join also helps, as does referring to large, respected organisations that have already signed up.
- Research-based campaigning (making the campaign more specific).
- Regular, short newsletters to activists, keeping them engaged.
- Unpacking the meaning of the term 'poverty' through situations that people recognise.
- Real-life case studies.
- Use of video material (Wrong Trainers video, video message from young people, video made by Chris Parker with short interviews with rally participants).
- Use of new media (website with option of posting a message, Facebook site).

Evidence

- Staff perceptions of what works on the basis of their past campaign experience.
- Membership growth (150 members, including not only the usual suspects).
- Members willing to reference ECP in their newsletters and press releases or on their websites; members paying membership fees and attending, contributing to and promoting the ECP rally; members willing to share their celebrity lists with ECP.

- Feedback from rally participants: congratulatory emails from members, the rally being described as an uplifting event, participants commenting that this was their first ever rally (comments captured in ECP video with vox pops of participant).
- Politicians (including the Prime Minister who initially declined the invitation) willing to meet ECP, participating at ECP events, calling for participation in the ECP rally at party conferences, witnessing the ECP rally, referencing ECP (and its effectiveness) in the House of Commons and in the media, etc.
- Politicians formulating/renewing child poverty commitments, including a £1 billion child poverty investment in the 2008 Budget – a government minister mentioned the ECP by name as being crucial in putting the pressure needed on Government to deliver.
- Media coverage, including regional and local media coverage for ECP statistics on child poverty and media coverage for ECP research.
- ECP estimates of 10,000 people attending the rally on 4 October 2008, including attendance from across England and from Northern Ireland, Scotland and Wales.
- More than 2,500 messages posted on the ECP website to date for a petition that has been running since November 2008.
- More than 3,000 members of the ECP Facebook site to date.

Debt on our Doorstep campaign

(Lead) organisation(s)

Church Action on Poverty, together with the National Housing Federation, Oxfam and Citizens Advice Scotland, and many local advice services, credit unions and community groups; later the *Daily Mirror*

Aim

To end extortionate lending and ensure universal access to affordable credit and other financial services.

Building public support for the UK poverty agenda

Indirectly, by raising awareness of how debt links to poverty in the UK, and of the extent and impact of extortionate lending on low-income groups.

Timing/scale/resources

Founded in 1999, an ongoing national campaign involving a wide range of predominantly voluntary and faith organisations. Picked up by the media in 2004.

Achievements

- Reaching beyond usual suspects (tabloid and glossy magazine readers, daytime TV viewers).
- Generating media coverage (story taken up by mainstream TV and the press).
- Raising awareness (GMTV, *Sunday People* and *Daily Mirror* subsequently run their own campaigns against loan sharks).

What works

- Avoiding 'poverty' but covering a specific issue (loan sharks and doorstep lending).
- 'Deserving' poor against a 'villain': loan companies taking advantage of people in vulnerable situations.
- Going beyond usual suspects by getting a message right: a clear enemy or villain and victims; an emotive story, which was a specific issue.

- Research: convincing and careful research undertaken by local groups who were able to gain people's trust and find 'case study' individuals who were articulate and willing to speak out.
- Combining a direct advocacy with MPs, key civil servants and quangos (e.g. Competition Commission), and linking the issue with wider government policies (e.g. Child Poverty Review).

Evidence

- Collation of informal feedback: extensive media coverage – BBC and ITV breakfast news, *Working Lunch*, consumer affairs on radio, *Watchdog*; tabloid campaigns (*The People* and *Daily Mirror*).
- Online monitoring: hits on the website and blog traffic.

Further information

Niall Cooper, Co-ordinator, Church Action on Poverty

Tel: 0161 236 9321, niallc@church-poverty.org.uk
www.debt-on-our-doorstep.com/index.html

Destitution campaign

(Lead) organisation(s)

Refugee Action

Aim

The overall aim is to achieve policy change: the provision of support to refused asylum-seekers to prevent them from becoming destitute.

Building public support for the UK poverty agenda

Building public support for the UK poverty agenda is not the primary aim (policy change is). There is, however, an element of public engagement: Refugee Action supporters are being asked to email or write to their MP.

Timing/scale/resources

The Destitution campaign is a national campaign; it was launched in 2007 and is currently ongoing. The campaign is managed by one full-time member of staff and is part of the Still Human, Still Here coalition (including, among others, Amnesty International, Church Action on Poverty and the Refugee Council).

Achievements

- Getting individuals to participate in activity (getting supporters to email MPs).
- Generating media coverage (especially in the specialist and local media; also national coverage – interviews on *Newsnight* and the *Today* programme).
- Changing attitudes (Home Office accepting that one-size-fits-all approach may need to change – rejected asylum-seekers refuse to go home for different reasons).

What works

- Specific messaging with a clear solution: the Australian example of ‘counselling’ support to refused asylum-seekers.
- Research-based campaigning (2006 Refugee Action report *The Destitution Trap*).

- Use of statistics and facts to evidence the extent of the problem.
- Moral arguments (inhumanity) combined with arguments about ineffectiveness (lack of support does not encourage individuals to return to their country).
- Use of the term ‘destitution’ to underline the message that refused asylum-seekers have no access to any support whatsoever.
- Unpacking the term ‘destitution’ through real-life cases (Refugee Action’s own experience of destitution among refused asylum-seekers seeking its support).
- Use of a champion: the Archbishop of York leading a delegation to the Home Office. The delegation also included the Red Cross, the Health Visitor Association and Amnesty International – not just the usual suspects from refugee charities.
- Partnership working – the Still Human, Still Here coalition. Development of the coalition was an important achievement in its own right, largely resulting from the Refugee Action and Amnesty International reports on destitution.

Evidence

- About 400 supporters (10 per cent of Refugee Action’s donors) emailed their MP.
- Access to senior politicians (as part of the Still Human, Still Here coalition).
- Perceived changes in the response and tone of politicians.
- Support for the campaign in the House of Lords, among faith leaders and leading health professionals.
- Systematic media tracking used in quarterly Refugee Action reporting.
- Journalists interested in the opportunity to interview refugees (real-life stories).

- Anecdotal feedback that people are shocked to learn about levels of destitution.

Further information

Sandy Buchan, Chief Executive, Refugee Action
SandyB@refugee-action.org.uk
www.refugee-action.org.uk/campaigns/destitution

Fair Pay League

(Lead) organisation(s)

Fair Pay Network

Aim

The overall aim is to get a commitment from premiership clubs to give all staff:

- a fair wage (at least £7.45 per hour in and £6.80 outside London);
- the right to paid holiday and parental leave;
- equal treatment for agency staff.

Building public support for the UK poverty agenda

Building public support for the UK poverty agenda is not the primary aim of the campaign (getting premiership clubs to change their employment policies is), but the Fair Pay Network's broader aim is to change the 'climate of opinion' about low pay in the UK.

Timing/scale/resources

The Fair Pay League is a national campaign; it was launched in the summer of 2008 and is currently ongoing. The campaign is managed by a partnership (the Fair Pay Network) of 16 national partners and run by two full-time staff. Network partners provide additional resources (for example, secondments) as and when needed.

Achievements

- Reaching out beyond the usual suspects (British football supporters).
- Generating media coverage (broadsheet and tabloid coverage).
- Getting people to participate in activity (write or call in support).
- Changing behaviour (clubs considering changing their employment policy).

What works

- Specific messaging with a clear solution (introducing a living wage for low-paid workers in the Premier League); 'no-brainer' messaging around 'deserving' poor (working people on a low income) up against a 'villain' (well-paid Premier League directors).
- Research-based campaigning: research about the prevalence of low pay through analysis of vacancies in the Premier League, also references to JRF research.
- Information-sharing: elaborate briefings (alongside short press releases).
- Use of 'fairness' terminology and argumentation (rather than 'poverty').
- Life stories.
- New media: Facebook site.

Evidence

- Staff views and feedback from MPs and journalists that life stories are powerful; life stories are also what the media are asking for.
- Wide-ranging support for the campaign: Barclays (sponsor of the league), Mayor of London (who has written to the five London clubs), Minister for Sport.
- Media coverage for the campaign including front-page coverage in the *Evening Standard* and coverage in the *Daily Mirror* and the *Sun*, presentation of the campaign during a national broadcast with about 2.5 million viewers.
- Research is being picked up in media coverage.
- Reactions from the wider public (football supporters) to a radio interview about the campaign on the national TalkSport channel: anger from listeners about the injustice of the current situation expressed during the phone-in.

- Preliminary interest from three (out of 20) clubs in signing up for the Pledge.
- 113 members of the Fair Pay League Facebook site.

Mark Donne, Director, Fair Pay Network
Tel: 0207 864 9928, mark@fairpaynetwork.org
www.fairpaynetwork.org/football

Fair Tipping campaign and Fair Tips, Fair Pay campaign

(Lead) organisation(s)

Unite, the *Daily Mirror* and *The Independent*

Aim

Two separate campaigns called on the hospitality industry to support the Unite and *Daily Mirror*'s Fair Tips Charter and *The Independent*'s Fair Tips, Fair Pay campaign to demonstrate their commitment to ensuring tips and service charges are distributed fairly among staff.

Building public support for the UK poverty agenda

The campaign is not building public support for the UK poverty agenda, but raising awareness of malpractice within the hospitality industry where some organisations pay restaurant staff less than the minimum wage and then make up the difference with tips.

Timing/scale/resources

Two separate campaigns took place in the spring of 2008. The *Daily Mirror* readership is 1.5 million and *The Independent* readership is around 760,000.

Achievements

- Raising awareness through media coverage: the issue was raised in two major newspapers.
- Getting people to participate in activity and change behaviour. Feedback for the tipping story has been strong, suggesting that people have started to think about what happens to tips and that it should be the staff benefiting from them. The campaigns have resulted in hospitality sector businesses signing the charter and the Government taking action by setting a code of practice.

What works

- Importance of a champion and media pressure: the media was able to get a critical mass behind the issue.

- Being specific and having a solution: a change in legislation to stop malpractice.
- Up against 'the villain': large corporations paying their staff less than the minimum wage.
- Not undermining the public's own interest: customers deciding who should get the tips; there was a need to inform as people were not aware of the issue.
- Peer pressure: big chains and federations signed the charter, putting pressure on others to do the same.
- Celebrity advocacy: celebrity chefs backed the campaign.
- Cross-sectoral partnership all behind the issue: unions, leading chefs, politicians and restaurant guides.

Evidence

- Many of the well-known chains have now signed the charter.
- After the Unite and *Daily Mirror* Fair Tipping campaign, *The Independent* newspaper picked up the story and ran an intensive campaign over a two-week period, which culminated in the campaign appearing on the front page of the newspaper. The paper received approximately 300 comments strongly supporting the campaign.

Further information

Nick Sommerlad, Columnist (Consumer Affairs), *Daily Mirror*

Tel: 020 7293 3741

Mark Hickman, Consumer Affairs News Editor, *The Independent*

Give Me Five campaign

(Lead) organisation(s)

FOCUS (Freedom of Choice United Services) is a separate structure within The Richmond Fellowship Scotland

Aim

The campaign was set up in a response to the fact that the weekly amount of pay for permitted work paid to people on Incapacity Benefit (IB) has not increased from £20 since 2001, although there have been several increases in minimum wages. Whereas, in 2001, people on IB could work around five hours a week, this has reduced to 3.5 hours a week because of this.

Building public support for the UK poverty agenda

Building public support for the UK poverty agenda is not the primary aim of the Give Me Five campaign (getting Government to increase the weekly amount of permitted pay is).

Timing/scale/resources

November 2006 to March 2008, run by one co-ordinator supported by volunteers.

Achievements

- Getting people to participate in activity: 3,500 people (including most of the SMPs) signed the Give Me Five petition, of which 1,000 signed online.
- Raising awareness: FOCUS launched a website and generated many press releases, posters and leaflets, which were distributed in GP surgeries, libraries and other public places.

What works

- Having a specific issue: an increase of weekly permitted work pay by £5.
- Word-of-mouth and peer pressure: the campaign was launched in the Scottish Parliament; most of the SMPs signed the petition.

- People who were directly affected actively recruited people to sign the petition in local communities (e.g. neighbours, club members). These tended to be older people with more time and good social networks (some came back with 150 names).
- Celebrity advocacy: the campaign used photos of three celebrities targeting different audiences (a soap star, an ex-footballer and a commentator and newsreader) when the campaign was launched in local (free) newspapers.

Evidence

- Monitoring of supporter activity: the number of people signing the petition.
- Monitoring of supported characteristics: the number of SMPs signing the petition.
- Parliamentary monitor: monitoring undertaken internally where the project manager logged daily into parliamentary discussion online to view any activity on the subject.

www.trfs.org.uk/absolutenm/templates/focus.aspx?articleid=274&zoneid=34

Living Wage online petition

(Lead) organisation(s)

Nick Wall

Aim

The aim of the petition was to educate people and to get as many signatures as possible in support of the living wage: a wage standard set higher than the current minimum wage to enable working people on a low income to escape poverty.

Building public support for the UK poverty agenda

Building and demonstrating public support for a living wage was an explicit objective of the campaign.

Timing/scale/resources

The petition ran between March and September 2007. The online petition and a dedicated Living Wage website were managed by a single individual on a voluntary basis. The petition ran parallel to a series of different campaigns championing the introduction of a living wage.

Achievements

- Reaching out beyond the usual suspects (emails sent out to about 10,000 individuals).
- Getting people to participate in an activity (getting people to sign the petition).
- Raising awareness and changing attitudes (getting people more interested in the issue).

What works

- Specific focus with a clear solution (introducing a living wage).
- A campaign focusing on the 'deserving' poor (working people on a low income).
- Registration of the petition on the Number 10 website (open process) – any petition

with more than 100 signatures triggers a government response.

- Collection of signatures through a dedicated website and by sending out emails, mainly targeting people who were expected to be sympathetic to the principle of a living wage (trade unionists, anti-poverty campaigners, Labour Party and Green Party politicians, poverty researchers). Several thousand emails were sent out; email addresses were obtained through internet searches.
- Partnership working: support from the London Citizens' Living Wage campaign.
- Research-based campaign: use of research supporting the case for a living wage.

Evidence

- 1,272 signatures to the petition, including signatures from 87 prominent signatories (38 local councillors, twelve local TUC secretaries, two MEPs and one former MP).
- About 4,400 website hits on the Living Wage petition website.
- A number of organisations/individuals posted links to the petition, including the Northern Ireland Anti-Poverty Network, Church Action on Poverty, Moot community, No Sweat, Brent Trades Council and Jean Lambert MEP. Similarly, a number of bloggers (six mentioned by name) posted links to the petition.
- Feedback via email: negative reactions related only to unease about how the petition got hold of people's contact details; no one commented negatively about the living wage concept. A limited number of people (including one councillor) were interested in finding out more about the living wage campaign.
- Evidence about the wide appeal of the living wage concept (not this petition as such): more

than 120 US cities and states have passed living wage legislation since 1994; within the UK, living wage campaigns are being managed in London, Cambridge, Oxford, Norwich, Glasgow, Scotland-wide and elsewhere.

Further information

<http://livingwageuk.wordpress.com/>

One Million Children campaign

(Lead) organisation(s)

Shelter in partnership with a wide range of organisations providing pro bono work

Aim

The campaign addressed the impact of bad housing on children's lives and sought to end bad housing for the next generation of children.

Building public support for the UK poverty agenda

Not directly building public support for the UK poverty agenda, but building public support for decent affordable housing.

Timing/scale/resources

April 2004 to December 2006, England-wide. The total expense of the campaign (including non-staff costs) was around £650,000. The campaign benefited from a range of offers of pro bono work, adding up to calculated savings of more than £1 million in fees.

Achievements

- Opinion-formers and decision-makers seem to hold the opinion that the campaign has been effective in making bad housing and homelessness a greater public priority, even if polling data does not necessarily support this observation.
- A variety of media and channels with wide-ranging outputs (press advertising, presence in music festivals and other events, poster sites at Westminster tube, online virals).
- Reaching beyond the usual suspects: 66 per cent of those signing up to the campaign were not from Shelter's existing donor base.
- Getting people to participate: by signing the petition and participating in campaign events, participation of service users, politicians and policy-makers.

- Changing behaviour: the principle that more social housing is needed seems to have been established, representing a key attitudinal shift in Government.

What works

- Combination approach: lobbying engagement and pressure, campaigning action and the generation of wider manifestations of public concern, engendering both actual concern as well as a constructed sense of it (perception of public concern).
- Integration of messages and activity across campaigns, marketing and fundraising initiatives.
- A specific focus (children) and linking the campaign to governmental priorities.
- Strong internal buy-in by the lead organisation.
- Celebrity advocacy: helped to increase the visibility of the campaign through the media.
- Direct user involvement meant communicating to the media and to key individuals had more impact.
- Use of new media: developed a substantial campaign presence on the Shelter website; gained a Google ad words grant to promote the site; online recruitment of campaigners.
- Innovative tactics captured popular interest through media coverage, stimulated active support and provided effective means to secure political attention more directly.
- Cross-sectoral partnership benefited from a range of offers of pro bono work and enabled the recruitment of campaigners.

Evidence

- Formal evaluation: evidence gathered by staff and external evaluators.

- 34 million opportunities to view (OTV) campaign messages through advertising and events, and 600,000 OTV through leaflets and inserts; 2,700 items of media coverage with 615 million OTVs.
- 100,000 campaigners were recruited and thousands more have showed support through their actions.

Business Action on Homelessness (BAOH)

(Lead) organisation(s)

Business in the Community – a business-led charity with a membership of over 850 companies committed to improving their impact on society

Aim

BAOH aims to engage businesses to help homeless people and those at risk of homelessness to gain and sustain employment. Through its Ready for Work programme, homeless clients participate in a two-day training programme and then are offered supported work placements with a company. Clients can be matched with a job coach from a company who supports them to gain and sustain employment.

Building public support for the UK poverty agenda

The programme does not overtly aim to build public support for UK poverty eradication but builds business awareness of homelessness, and engages businesses to support homeless people to gain and sustain employment through its Ready for Work programme.

Timing/scale/resources

A national partnership between over 350 businesses, homeless agencies and the Government, operating in 22 locations across the UK and Ireland, which originated from a piece of research undertaken by Bain and Company in 1998.

Achievements

- Reaching beyond the usual suspects: 112 businesses are currently involved.
- Engaging businesses and their staff to participate in the programme at both the boardroom and operational level. This can act as the catalyst for them forming wider partnerships with homelessness organisations either locally or nationally and/or for developing employment programmes focusing on other disadvantaged groups.

- Challenging perceptions and stereotypes about homelessness. Business volunteers act as ‘buddies’ and coaches for people on the programme. These volunteers frequently report that the programme has changed their perceptions about homeless people and homelessness.

What works

- A strong partnership between businesses, homeless agencies and the Government.
- Having a strong business case that articulates the value of business engaging with the programme, e.g. recruitment, professional and personal development opportunities for staff through supporting the programme as ‘buddies’ and job coaches.
- Strong business leadership of the campaign. The Group CEO of Barclays chairs a board of senior business leaders who steer the strategic direction of the campaign.

Evidence

- In 1998 and 2006, Bain and Company carried out research into consumer and business attitudes towards homelessness, which shaped the business case and priorities for businesses supporting homeless people.
- Feedback forms: BAOH does not measure the effectiveness in terms of raising awareness of poverty reduction, but all the volunteers are invited to fill in an evaluation form stating what they learnt from the experience. The largest organisations provide more formal feedback.
- Monitoring supporter characteristics and activity: more than 350 companies in 22 cities have been involved over the last five years, including many major corporations.

Dare to Care: make time to help end child poverty

(Lead) organisation(s)

A partnership between CSV and the Campaign to End Child Poverty, including the four 'theme month' partners: Barnardo's (families), Children's Links (health), NCH (money management) and The Children's Society (education). The campaign was funded by the Office of the Third Sector.

Aim

To increase citizen commitment to ending child poverty by engaging 35,000 people as volunteers. The campaign highlighted the extent of child poverty in England and offered practical advice and solutions to some of the problems.

Building public support for the UK poverty agenda

One of the core aims of the campaign was to engage with the scepticism that often exists around poverty and create an awareness of child poverty in all its forms and the combative action that can be taken.

Timing/scale/resources

The campaign ran over a five-month period (October 2007 to February 2008), secured £1.2 million in funding and had six full-time CSV staff, as well as support based in the 'theme month' partner organisations.

Achievements

- Changing behaviour: 87 per cent of partners intended to continue their projects after the campaign had ended and 95.8 per cent of volunteers intend to volunteer again.
- Generating media coverage: 782 print and web pieces (which included 66 national print and online articles) and 385 TV and radio broadcasts, with at least seven national TV pieces.
- Getting people to participate in activity: nearly 39,000 volunteers were recruited by partners, with the help of local CSV Action Network based in local BBC radio stations.

- Reaching beyond the usual suspects: 66.3 per cent of the volunteers who were recruited had never volunteered to help children before joining the campaign.
- Building capacity: a total of 156,458 children and 54,669 parents benefited through the time given by these volunteers.

What works

- Need to inform: people are not aware of the extent and effects of UK poverty.
- Face-to-face contact: volunteers are in direct contact with families living in poverty.
- Intra- and cross-sectoral partnership: voluntary sector agencies and service providers with activity co-ordinated by local partners.
- A strong visual identity to achieve maximum impact during the short time available for the campaign.
- Advertising and recruiting: 600,000 campaign postcards at cinemas and universities, London bus and tube ads, a sustained media relations campaign and a range of direct mail, email, web and telemarketing methods to target specific audiences.

Evidence

- Feedback collated by activity organisers, volunteers and partners.
- Media coverage: the combined print, web and broadcast circulation in excess of 23.8 million and the combined weekly reach by TV and radio of 40.3 million.
- Survey evidence that the marketing campaign brought about a shift in knowledge about and attitudes towards child poverty.
- Widespread regional impact, plus success in reaching people in poverty – over 50 per cent of all volunteering opportunities created were in

the 20 per cent of local authority areas with the highest proportion of families on state benefits.

Fit4Finance: financial education training

(Lead) organisation(s)

Britannia Building Society in partnership with secondary schools

Aim

The staff volunteering is a tool for learning and development via real-life activities while at the same time making a difference in the local communities. All the activities are linked under the Community Involvement Policy to work in education related to numeracy, financial literacy and money advice. Fit4Finance is an education programme to improve financial capability. It is for use within secondary schools.

Building public support for the UK poverty agenda

The training activity is not aiming to build public support for the UK poverty agenda. Rather, it is aiming to develop staff, provide life skills to young people and their families, and keep them informed on financial matters in support of the Financial Services Authority (FSA) Financial Capability Strategy.

Timing/scale/resources

Ongoing regional programme delivered in Staffordshire, Cheshire, Derbyshire, Bristol, Bath, Ipswich and Wales by 175 employee volunteers.

Achievements

- Raising awareness and building capacity: to date nearly 175 employees have coached over 3,400 students. Evaluations completed after the full-day programme show a 40 per cent average improvement in the students' knowledge of personal finance.
- Reaching beyond the usual suspects: involving young people and their families.
- Empowering young people (some of who may be living in poverty) and informing them of the dangers of debt and poor budgeting.

What works

- Face-to-face contact: staff who volunteer visit schools.
- Light touch: the programme introduces students to the basics of personal finance through a series of engaging and interactive workshops tailored to meet each school's needs. The workshops cover topics such as opening and managing an account, budgeting, savings, and credit and debt.
- Building capacity by developing family learning sessions with schools in which parents would participate; family budgets would be used as examples and the whole family would learn how to save money or how to make it to go further. This would be an effective way to reach out to parents and make participation easy, as they would be 'helping out their children' while at the same time learning about money matters.

Evidence

- No evidence is gathered on awareness-raising (as it is not the aim of the activity).
- Evaluation forms are completed at the end of day-long courses by students and teachers. Students are also tested before and after the course on personal finance knowledge. Students are requested to leave feedback via the website after the event on whether they have changed their behaviours around money.
- Good anecdotal feedback from teachers.

The Big Issue: a magazine produced by professional journalists and sold on the streets by homeless people

(Lead) organisation(s)

The Big Issue

Aim

The Big Issue offers homeless people the opportunity to earn a legitimate income, thereby helping them to reintegrate into mainstream society.

Building public support for the UK poverty agenda

Not directly; the core aim of *The Big Issue* is to give people a legitimate way of making a living. Editorially, *The Big Issue* magazine is committed to giving homeless people a voice in the media and raising difficult issues that are overlooked in the mainstream press.

Timing/scale/resources

Since 1991, national with regional offices – distribution across all UK cities, readership of around 179,000.

Achievements

- (Potentially) reaching out beyond the usual suspects: people buying a magazine.
- Raising awareness: a dedicated section in each magazine for homeless contributors, visibility of homeless vendors on the streets.
- (Potentially) changing attitudes: people talking to vendors and changing their attitude.

What works

- Celebrity advocacy: interviews with and pictures of celebrities on the magazine cover.
- Face-to-face contact: vendors are able to communicate with the public and share their stories.

- Light touch, no preaching.
- Having a solution: the public see homeless vendors making a legitimate living.
- Champion: the founder of *The Big Issue* used to be homeless himself; he is charismatic and appears frequently in the media in discussions on homelessness.

Evidence

- Media and online tracking: on any mention of *The Big Issue* or the founder of the organisation, although the objective is not to raise public support for poverty eradication, rather to highlight issues around homelessness.
- Collation of informal feedback: letters to the editorial, anecdotal evidence through public and vendor feedback.
- Focus group feedback: the key aim of focus groups is to understand their existing support base but also to test public understanding of *The Big Issue* (and UK homelessness).

Winter Deaths campaign

(Lead) organisation(s)

British Gas Help the Aged Partnership, with support from DWP Pension Service

Aim

The campaign aims to help older people get the benefits they need so they can afford to heat their homes properly and to raise public awareness of fuel poverty through the national media.

Building public support for the UK poverty agenda

The aim is not to build public support for the UK poverty agenda but to get older people to claim benefit entitlements and to encourage the automatic payment of benefits. A media partnership with GMTV raises public awareness of the scandal of winter deaths.

Timing/scale/resources

Annual campaign as a part of GMTV programme over one week in November. The 2007 campaign included themes for each day: fuel poverty, benefits, energy efficiency, health and national day for action. Viewers were able to phone in to receive a free 'Your Winter Warm Up' pack and a greeting card with a voucher for free benefit checks. The pack was developed in partnership with the DWP Pension Service.

Achievements

- Reaching out beyond the usual suspects: daytime TV viewers.
- Raising awareness and getting people to act: sending greeting cards to their older friends and relatives, and getting older people or their relatives to order packs.

What works

- Research evidence: two specific pieces of research, which have been used in the media to push for policy change.
- Media pressure: 'prompting' a response from the Government.

- Celebrity advocacy: June Whitfield (the grandmother from *Absolutely Fabulous*) talks about winter deaths in the film shown online and in selective GP surgeries.
- Use of new media: a short online film about the scandal of winter deaths.
- Personal stories used in the media.
- Use of poverty (in terms of fuel poverty) as a media hook (the scandal of winter deaths).
- Obvious injustice ('no-brainer'): vulnerable older people dying because they cannot afford to heat their homes.
- Effective win-win partnership with a charity, private and public sector organisation.

Evidence

- Media and online tracking: to measure PR in general, Help the Aged uses opportunities to see (OTS) calculations and the latest campaign had 120 million viewings.
- Monitoring supporter activity: in 2007, over 75,000 Pension Service greeting cards were distributed via the whole campaign (50,000 responding to the TV campaign). In addition, a total of 120,000 thermometers were given as a part of the GMTV partnership.
- DWP did some analysis of different engagement methods and compared the card scheme with some other approaches they were involved with – the card scheme fared quite well.

Anti-Poverty Strategy and Action Plan

(Lead) organisation(s)

The Gateshead Housing Company

Aim

The strategy details the organisation's commitment to reducing the effects of poverty among its tenants because of the adverse effects that poverty has on individuals and communities.

Building public support for the UK poverty agenda

The strategy builds support for the UK poverty agenda among the organisation's staff and partners by detailing the Housing Company's commitment to reducing the effects of poverty.

Timing/scale/resources

A local strategy initiated in 2005 for three years; the company employs around 400 staff, of which 40 are based in the rent and income team (six of these are new posts working with new tenants in a preventative capacity).

Achievements

- Snowball/trickle effect: since the initial strategy, Gateshead Council and stakeholders from the public and voluntary sector in Gateshead have come together to develop a new Gateshead-wide anti-poverty strategy focused on four key themes of debt, benefits, worklessness and housing.
- Changing attitudes and behaviour: new procedures to increase staff awareness and change the way they work with tenants.
- Changing behaviour: providing mechanisms and solutions for tenants to build their capacity and 'help themselves'.

What works

- By developing the strategy, the Housing Company has deepened its understanding of the adverse effect of poverty on its tenants and

has come up with a number of mechanisms and activities to alleviate the effects of poverty.

- Partnership with the Citizens Advice Bureau (CAB) and local credit union means an improved access to specialist advice (e.g. access to CAB adviser diaries to book appointments for tenants).

Evidence

- The strategy had been viewed 2,379 times online by November 2008.
- The number of tenancies failing in the first year had reduced from 538 when the company was formed to 173 in 2007/08 and the extra preventative work with those most at risk, including advice on benefits and finances, has halved the failure rate for customers aged under 25.
- Arrears are falling also by the wider tenant population.
- The local authority has since taken on the initiative to develop its own borough-wide anti-poverty strategy in partnership with the service providers and voluntary sector in Gateshead.

Borders challenge paper: *Tackling Poverty in the Scottish Borders*

(Lead) organisation(s)

Scottish Borders Council

Aim

Local research and consultation took place with the aim of investigating the local prevalence of poverty and presenting the findings as a 'challenge document' to the Council and community planning partners – encouraging them to act.

Building public support for the UK poverty agenda

The aim is to put poverty higher on the political agenda – awareness-raising is aimed mainly at local councillors. The research also has the potential to raise awareness indirectly among other actors (service providers and the wider public).

Timing/scale/resources

The research took place during the autumn of 2007 and first half of 2008. The research report was launched in December 2008 during an event where the challenge document was formally handed to the Leader of the Council. Financial resources were available for the research. Participation in the Poverty Commission, which was responsible for drawing up the challenge document, was on a voluntary basis.

Achievements

- Reaching beyond the usual suspects (wide-ranging consultation).
- Getting people to participate in activity (getting people to participate in the consultation and research, getting people to attend the launch event).
- Generating media coverage (BBC website, Borders ITV, local press).
- Raising awareness (among councillors, Scottish Borders Council staff and partner agencies).

- Putting poverty higher on the political agenda (allocation of funds to tackling poverty despite budgetary constraints).

What works

- Comprehensive approach to the research and consultation, with involvement of academic researchers, the voluntary sector and people experiencing poverty.
- Real-life case studies – a direct dialogue between senior officials and people experiencing poverty during a Getting By, Getting Heard poverty hearing event.
- Informing people about what it actually means to live in poverty.
- Existing interest in and support for anti-poverty action among councillors and council officials, including support from the portfolio holder and Head of Housing and Social Work Strategy. Councillors sat on the Commission that drafted the challenge document; councillors also participated in the launch event, as did the local MP and a lord, thus helping to raise the profile of the event.
- Local circumstances: strong sense of community in the Borders area.
- Time-intensive process – giving examples and challenging stereotypes, not frightening people but explaining how poverty can happen to everyone.

Evidence

- Staff perceptions of what works.
- About 90 to 100 people attended the launch (despite a date in run-up to Christmas), including participation of elected member, the local MP and a lord.
- Feedback from launch participants and partner agencies – people were positive about the event organisation and impressed about the participation of politicians.

- Anecdotal feedback: surprise at how pervasive poverty is in the Borders.

Capital Gains report

(Lead) organisation(s)

London Child Poverty Commission

Aim

The overall aim of the London Child Poverty Commission is raising awareness about the prevalence of child poverty in London and putting London child poverty higher on the political agenda. *Capital Gains* was the Commission's final report, presenting its main findings and recommendations.

Building public support for the UK poverty agenda

The Commission identified public attitudes towards poverty as an area of concern but, because of time and resource constraints, prioritised targeting policy-makers and organisations active in the field (rather than the wider public).

Timing/scale/resources

The Commission was set up in February 2006 and will sit until 2010. *Capital Gains* was launched in February 2008. The Commission is an independent body, bringing together 21 commissioners from different backgrounds. London Councils and Greater London Authority officials provide secretarial support; funding for the full-time co-ordinator post was provided by the London Development Agency.

Achievements

- Going beyond the usual suspects (also engaging with employers, people joining the Commission from a range of different backgrounds).
- Getting people to participate in an activity (people joining the Commission).
- Generating media coverage (for the final *Capital Gains* report).
- Raising awareness (implicit evidence only).

- Changing behaviour (Commission's policy recommendations taken forward – for example, inclusion of child poverty in local area agreements on the basis of the Commission's local area agreement guidance).

What works

- Research-based campaigning – call for evidence (sent to 700 stakeholders).
- Presenting people with information about how challenging the situation is.
- Wide partnership: politicians, voluntary sector, researchers, trade unions and practitioners acting as commissioners.
- High-level political buy-in – for example, attendance of the Mayor at the conference.
- Having a champion, e.g. the Deputy Mayor acting as champion at City Hall.
- Use of term 'poverty' (Child Poverty Commission) was not necessarily a problem.
- *Wrong Trainers* cartoon (BBC *Newsround* production) on Commission's website.
- Real-life stories (*Wrong Trainers* animation is based on real-life stories).
- Use of external PR expertise to launch the *Capital Gains* report.

Evidence

- Evaluation of the *Capital Gains* launch including a detailed breakdown of media coverage at national, regional and local level (launch, for example, picked up by BBC London) and an overview of which messages were picked up the most.
- Comparison with media coverage for the Commission's previous reports.

- All stakeholders invited were happy to join the Commission (no refusals to date).
- Staff perceptions: Commission has a high profile – also supported by politicians’ willingness to engage with activities, by references to the Commission in policy documents (e.g. HM Treasury Budget) and by the Commission’s messages being taken on board (e.g. introduction of London dimension to the Child Poverty Unit).
- Staff perceptions: *Wrong Trainers* is powerful – also supported by references to the cartoons on websites and BAFTA and Royal Television Society awards.
- Emails sent to the generic London Child Poverty Commission email address from around the world – requests from students, journalists and people on low income asking for advice.

Child Poverty Solutions Wales toolkit

(Lead) organisation(s)

Welsh Local Government Association (WLGA), Save the Children and the Welsh Assembly Government

Aim

The aim of the project is to promote a corporate approach to tackling child poverty within local authorities. This is being done by:

- offering local authorities an online child poverty toolkit (www.childpovertysolutions.com);
- supporting two local authorities in their child poverty work.

Building public support for the UK poverty agenda

The programme aims to build support for the child poverty agenda by raising local authorities and local service providers' awareness of their role in tackling child poverty.

Timing/scale/resources

Partnership approach: project management (and funding) by Save the Children and WLGA, with additional funding from the Welsh Assembly Government. Other organisations (health, social services and other charities) sit on the project steering group. The project was initiated in October 2007 and ends in December 2009. Staff resources include a full-time Save the Children employee and a part-time (20 per cent) secondment from WLGA.

Achievements

- Reaching beyond the usual suspects (going beyond children's services).
- Getting people to participate in activity (local authorities piloting the different tools in the toolkit, councillors participating in training).

- Generating media coverage (sectoral magazines, local radio, Welsh national press).
- Raising awareness and changing attitudes (placing child poverty higher on councils' agenda).
- Changing behaviour (child poverty embedded within corporate processes – for example, put on the agenda of scrutiny committee).

What works

- Government leadership: the UK Government and the Welsh Assembly Government identifying child poverty as a priority.
- Wider context of increased interest in child poverty (e.g. Communities First and Children and Young People partnerships are also looking at child poverty).
- Direct link with organisational priorities – councils need to have a single plan for children and young people covering seven core aims, including a poverty aim.
- 'Carrot and stick' approach: support to local authorities to help them deal with the poverty aim in their plans for children; considering the introduction of a statutory child poverty duty on local authorities.
- Research: making existing research accessible and relevant for local authorities.
- Partnership approach: different partners involved (National Public Health Service for Wales, Directors of Education and Social Services in Wales) encourage their local members/staff to engage with the toolkit.
- In-depth engagement with local councillors – the Child Poverty scrutiny process runs over a period of a few months enabling councillors to engage (compared to the one-off child poverty impact assessment training session).

- Multimedia: website with policy briefs, a database of practice and toolkit elements.

Evidence

- Stakeholder views: it is easy to engage councils with the process and toolkit.
- Comparison with previous projects (when child poverty had not yet been set as a national priority): low take-up among local authorities of the Quids for Kids scheme promoting Working Tax Credits.
- Website traffic monitoring: 1,516 unique visitors on the website between September and December 2008; the indicator pages are quite popular, as are the child poverty briefings area and the toolkit area; 40 visits registered in the elected members area; the duration of visit varies – more than three-quarters of visits (in November) were between two and 30 minutes; there are hits from outside the UK, including 50 hits from Germany.
- Findings from the interim evaluation (telephone survey of Children and Young People partnership staff focusing on whether or not they have used the website and whether it was easy to use): mainly positive feedback.

www.childpovertysolutions.org.uk/

Commission for Rural Communities (CRC)

(Lead) organisation(s)

Commission for Rural Communities

Aim

The aim of the Commission is to ensure that government policies reflect the needs of people living and working in rural England, with a focus on tackling disadvantage.

Building public support for the UK poverty agenda

The focus of the Commission is on influencing policy (rather than building public support) but, through its publications and communication work, it is involved in public awareness-raising.

Timing/scale/resources

The Commission was set up in 2005 and covers rural England. It employs about 70 staff, including secondees and has a total budget of about £6 million.

Achievements

- Getting people to participate in an activity (getting organisations to join the Rural Social Justice Coalition, getting stakeholders to attend conferences and events).
- Generating media coverage (not an end in its own right).
- Raising awareness (about disadvantage in rural areas and in particular about rural dimension of different policy areas) – awareness-raising is seen as the first step towards changing attitudes and behaviour (including a rural dimension in policy).

What works

- Use of a power/interest matrix to identify people in positions of influence to positively affect government policies.

- Partnership working: for example, through the Rural Social Justice Coalition – a recent coalition trying to build support for the rural anti-poverty agenda.
- Simple messaging.
- Personality of the spokesperson.
- Use of a wide range of communication tools: publications, DVDs, website, the Rural Advocate's fact-finding visits, conferences, workshops, seminars, the Whitehall newsletter, consultations, letters from the Rural Advocate to ministers, face-to-face meetings with key stakeholders and email. Also use of new media: CRC blogs, CRC YouTube channel and offer of RSS feeds to CRC website users.
- New media complement rather than replace traditional publications: the most popular blogs and webpages are linked to reports (e.g. *State of the Countryside* report); people go to the internet to find the electronic version or additional information on a publication they already know about (via the CRC newsletter, other government newsletters or RSS feeds).
- Real-life stories – young people's life stories in particular can be powerful. Videos presenting stories are more powerful than written case studies; they capture more of the environment than words or still pictures.
- Examples of specific locations illustrating particular rural challenges.

Evidence

- About 6,000 people signed up to CRC website RSS feeds.
- A few hundred people signed up to the monthly CRC newsletter.
- Number of viewings of YouTube videos (about 70 viewings of the *Financial Inclusion* video to date, posted about six months ago).

- Media tracking by an external media monitoring company and in-house.
- Website monitoring (unique visitors rather than total number of visits for a page).
- Stakeholder surveys including a large-scale February 2007 survey (300 interviews), which provides information on perceptions of impact:
 - just less than one in four believes the CRC influences policy;
 - just over one in three believes the CRC positively impacts on rural communities;
 - just over one in two is aware of the Rural Advocate role;
 - just less than one in four of this group think the Rural Advocate is influential.
- Local life stories are what the media ask for; journalists and event participants who see stories recorded on film comment about the power of the video materials.
- Stakeholder interest in the Rural Social Justice Coalition (e.g. parish councils).
- Anecdotal feedback (including from journalists): surprise about the extent and level of disadvantage in rural areas.

joanne.ward@ruralcommunities.gov.uk
www.ruralcommunities.gov.uk/

Dundee Local Anti-Poverty Strategy

(Lead) organisation(s)

Dundee City Council

Aim

The overall aim of the strategy is to raise service providers' awareness of poverty and of their role in addressing poverty.

Building public support for the UK poverty agenda

Raising awareness is an explicit objective of the strategy; the group targeted are service providers (rather than the public at large).

Timing/scale/resources

The strategy was developed six to seven years ago. It is being overseen by the Anti-Poverty Theme Group and is supported by a council officer.

Achievements

- Reaching out beyond the usual suspects (also involving services and agencies not initially involved in the anti-poverty agenda).
- Getting people to participate in an activity (participation in poverty-awareness training, in the Anti-Poverty Theme Group).
- Raising awareness (getting people to recognise their role in tackling poverty, informing people about the prevalence and meaning of poverty).
- Changing attitudes (getting people to recognise their role in tackling poverty).
- Changing behaviour (elements of the Anti-Poverty Strategy have been mainstreamed).

What works

- Research evidence: research undertaken locally (Dundee University and action research by the local Anti-Poverty Forum) facilitated the development of the strategy.

- Local context: high levels of deprivation and benefit claimants in Dundee, which had got worse following a change of boundaries.
- Wide recognition of the problem locally (including at political level) and lobbying by the local voluntary and community sector Anti-Poverty Forum.
- Infrastructure set up to oversee the implementation of the strategy (Anti-Poverty Theme Group, reporting to the Community Planning Partnership).
- Development of a poverty-awareness training CD, allowing flexible use of the CD and training by the different partner organisations, and for the training to be linked to training modules already planned by these partners – for example, poverty-awareness training linked to financial education training.
- Time-intensive (gradual) process: explaining what 'poverty' means through situations that people recognise.
- Community empowerment – if people living in poverty become more vocal about their concerns it becomes harder to ignore the issues.

Evidence

- Some elements of the strategy have been mainstreamed (leading to a recognition among partners that the strategy needs to be reviewed).
- About ten to twelve organisations have asked to use the poverty-awareness training CD – including, for example, housing associations (not traditionally engaged in the anti-poverty agenda).
- Evaluation of the training: very positive

responses, participants surprised that this was happening in their area.

London Child Poverty Pledge

(Lead) organisation(s)

Child Poverty Unit (DCSF/DWP).

Aim

The London Child Poverty Pledge aims to raise awareness of the contribution that people can make in their own organisations and jobs to reduce child poverty in London; the Pledge also aims to change organisations' behaviour to maximise their contribution to tackling child poverty.

Building public support for the UK poverty agenda

Public awareness-raising is an explicit objective, targeting organisations that deliver services to families in London.

Timing/scale/resources

The Pledge was launched in July 2008. A Child Poverty Summit was organised on 19 November 2008. Collection of signatures is ongoing. A Child Poverty Unit employee co-ordinates the project (but her remit is wider and covers all London projects).

Achievements

- Reaching out beyond the usual suspects (organisations not previously involved in or recognising their involvement in addressing child poverty).
 - Getting people to participate in an activity (signing the Pledge, attending the Summit, planning at senior level what they can do to tackle child poverty).
 - Generating media coverage (launch of the Pledge by Stephen Timms, BBC London coverage, some national media coverage).
 - Raising awareness and changing attitudes (getting people/organisations to recognise their role in fighting child poverty).
- ### **What works**
- Collection of signatures through a wide range of channels, including the internet, direct mail-outs, presentations and by getting partner organisations (e.g. TUC, London Councils) to publicise and promote the Pledge among their members.
 - Getting high-profile signatories on board (including the London Mayor).
 - High-level political commitment to child poverty – prime ministerial support for the agenda, launch of the Pledge by the Minister for Welfare Reform.
 - Wider context of increased interest in child poverty (e.g. work of the London Child Poverty Commission, child poverty in the local area agreement process).
 - Personal contact with potential signatories, starting from organisations' own priorities and remit, and explaining how this links to the child poverty agenda.
 - Building up towards an event (the Child Poverty Summit on 19 November 2008).
 - Real-life case studies: a parent on low income spoke at the Summit, children and young people were involved in a workshop at the Summit.
 - Use of new media: a YouTube video was launched on 25 September 2008. The video was emailed to partners and put on the DCSF and Every Child Matters website.
 - Research-based activity: use of research on what works in tackling child poverty from a range of sources, including work from the London Child Poverty Commission, Child Poverty Action Group and the Narrowing the Gap project.
 - Development of a good-practice guide.

Evidence

- Staff perceptions of what works in bringing people on board.
- The Pledge being referenced and promoted on partner organisations' websites.
- About 20 to 30 signatories to the Pledge to date, covering a wide range of organisations (primary care trusts, local strategic partnerships, local authorities – led by Labour, Conservatives and the Liberal Democrats, JCP London, voluntary sector). All have developed action plans.
- About 75 Summit participants similarly representing a wide range of organisations.
- Anecdotal positive feedback about the Summit: honest and open discussion with participants acknowledging the difficulties in addressing child poverty.
- Almost 7,500 viewings of the YouTube video to date (most popular video on the DCSF YouTube channel).

The Prince's Seeing is Believing (SIB)

(Lead) organisation(s)

Business in the Community (BITC)

Aim

The programme invites senior business leaders to see for themselves how business can play a role in tackling Britain's most pressing social issues in some of its most deprived inner city and rural areas.

Building public support for the UK poverty agenda

There is a considerable element of public awareness-raising. Senior business leaders are invited to write a detailed report on what they have found and consider what their business can do to tackle some of the most pressing social issues.

Timing/scale/resources

The Prince of Wales initiated Seeing is Believing in 1990, inviting business leaders to leave their desks and to join visits to different parts of the country where they could spend some time in inner city schools, homeless hostels, prisons or tough housing estates. The programme is open to chief executives, managing directors and board-level employees of national companies.

Achievements

- Raising awareness: the programme introduces participants to places and people they would otherwise be very unlikely to visit. This provides a valuable insight and a new understanding of the role of business in society.
- Reaching beyond the usual suspects and getting people to participate in activity: since 1990 more than 6,000 business leaders have participated in more than 450 visits.
- Changing attitudes and behaviour: about 70 per cent of participants reported that they had changed the way they do business as a result of their Seeing is Believing visit and 80 per cent had become personally more active in the local community.

What works

- Importance of a champion and 'celebrity' advocacy: HRH The Prince of Wales and chief executives of large corporations.
- Not undermining businesses' own interest: building a business case for tackling social exclusion.
- Need to inform but not to preach, talk about social exclusion rather than poverty.
- Importance of face-to-face contact: visits are powerful in opening the eyes of participants and giving them an opportunity to talk to those afflicted by poverty.
- Peer pressure: having major corporations on board.
- Intra-sectoral partnership: The Prince's Seeing is Believing has worked with over 1,200 community organisations and schools.

Evidence

- Monitoring supporter characteristics and activity: each participant has been asked to write a detailed report on what they have found and to consider what their business can do to tackle some of the most pressing social issues.
- Debriefing with staff and partners.

Acknowledgements

We would like to thank the many UK poverty stakeholders that agreed to participate in this research, in particular the 29 organisations that consented to be included in the research as a *named* case study. We would like to explicitly acknowledge the participation of Shelter and Community Service Volunteers (which co-organised the Dare to Care – Make Time to Help End Child Poverty campaign with the End Child Poverty coalition), which agreed to share their in-house evaluation reports in full. Both reports represent much that can be considered as best practice in impact assessment, including rare assessments of additionality and frank accounts of what has and has not worked.

We would also like to thank the members of the research's Project Advisory Group for their participation in meetings, for commenting on earlier drafts of the report and for giving advice and practical support to the research team.

Finally, we would like to acknowledge support by the Joseph Rowntree Foundation and, throughout the research, by Teresa Hanley, the Joseph Rowntree Foundation project manager of the Public Interest in Poverty programme.

About the authors

Joke Delvaux is a Research Consultant and heads the voluntary sector portfolio at Cambridge Policy Consultants. She has undertaken evaluations and impact assessments for Oxfam (UK), the European Fair Trade Organisation (Belgium), the European Association of Development Research Institutes (Germany), the European Anti-Poverty Network (Ireland), Church Action on Poverty (UK), Heart 'n' Soul and Spare Tyre (UK – funded by the City Parochial Foundation) and the Get Fair coalition (UK – funded by the Joseph Rowntree Foundation).

Sini Rinne is a Research Consultant at Cambridge Policy Consultants with ten years of experience in research and evaluation of welfare-to-work and social inclusion programmes. She has worked on evaluations of different Department for Work and Pensions welfare-to-work schemes including Multiple Provider Employment Zones, New Deal programmes and City Strategy Pathfinders and a range of employability and capacity building schemes funded through the Neighbourhood Renewal Fund, Working Neighbourhoods Fund or European Structural Funds.
